Microsoft AB-100 Actual Exam Questions Last updated on June 28, 2026. View Custom SettingsPrint Exam 97% Passed the exam with this material 112 Questions & Answers Included	

001 Question.

A company uses Microsoft Dynamics 365 Sales to manage leads that are stored in a Microsoft Dataverse table named Lead and use non-standard terminology and custom columns.

You need to configure business terms in the Lead table so that Microsoft Copilot controls can summarize the leads efficiently. The solution must minimize administrative effort.

How should you configure the business terms?

- A. Combine all the fields into one custom field.
- B. Map the field display names as business terms.
- C. Add the schema names as business terms.
- D. Create new business terms for each field.

Answer

Correct Answer: B

Explanation:

To let Microsoft Copilot summarize leads effectively with the least administrative effort, you should map the existing display names of the Lead table's fields to business terms. This avoids creating new terms manually and aligns Copilot with the terminology already used in Dynamics 365 Sales.

Discussion: <https://www.examtactics.com/discussions/microsoft/view/384378-exam-ab-100-topic-1-question-3-discussion/>

002 Question.

You are designing two Microsoft Copilot Studio agents named Agent1 and Agent2. Each agent must meet the following requirements:

- Each agent must use a standard model.
- Each agent must NOT use generative orchestration.
- Agent1 must support simple and short phrases for a given topic.
- Agent2 must integrate with Microsoft Dynamics 365 Contact Center voice channel.

You need to recommend language models for the agents.

What should you recommend for each agent? To answer, drag the appropriate language models to the correct agents. Each language model may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Language models

Azure Language in Foundry Tools

Azure OpenAI

Conversational language understanding (CLU)

Natural language understanding (NLU)

Natural language understanding + (NLU+)

Answer Area

Language model

Agent1:

Agent2:

Answer

Correct Answer:

Language models

Azure Language in Foundry Tools

Azure OpenAI

Natural language understanding + (NLU+)

Answer Area

Language model

Agent1: Natural language understanding (NLU)

Agent2: Conversational language understanding (CLU)

Explanation:

- **Agent1**

Requirements:

- Standard model
- No generative orchestration
- Handles *simple, short phrases*

Answer: *Natural language understanding (NLU)*

Why: NLU is the classic intent-based model in Copilot Studio. It is optimized for short utterances and deterministic topic triggering.

A. **Agent2**

Requirements:

- Standard model
- No generative orchestration
- Must integrate with Dynamics 365 Contact Center voice channel

Answer: *Conversational language understanding (CLU)*

Why: CLU is the only standard model that supports speech-to-intent scenarios and is required for voice channel integration.

Discussion: <https://www.examtopycs.com/discussions/microsoft/view/384379-exam-ab-100-topic-1-question-4-discussion/>

003 Question.

A company uses Microsoft Dynamics 365 finance and operations apps.

The company plans to use Microsoft Copilot in-app help and guidance to generate responses for internal business processes.

You need to add an additional knowledge source for the business processes. The solution must NOT add new topics to the Copilot agent for the finance and operations apps.

Which knowledge source should you add?

- A. Microsoft Dataverse
- B. a public website
- C. Azure AI Search
- D. a file upload

Answer

Correct Answer: B

Explanation:

You can add knowledge to the Copilot help and guidance feature by uploading files to Copilot Studio (in file formats such as PDF, RTF, or Word). If you want to add other types of knowledge (such as from SharePoint or other data sources), then you must add your own topic in the Copilot for Finance and Operations apps agent in Copilot Studio. Reference article <https://learn.microsoft.com/en-us/dynamics365/fin-ops-core/dev-itpro/copilot/extend-copilot-generative-help>

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384053-exam-ab-100-topic-1-question-5-discussion/>

004 Question.

A company has an AI business solution.

You need to extend the solution so that Microsoft 365 Copilot can invoke external logic hosted in Azure services.

What should you include in the solution?

- A. Microsoft Copilot Studio skills
- B. Microsoft Power Platform connectors
- C. custom engine agents

Answer

Correct Answer: A

Explanation:

Microsoft 365 Copilot can call **Copilot Studio skills**, which act as extensions that connect Copilot to:

- Azure Functions
- Azure API Management
- Custom REST APIs
- Power Platform connectors
- Other external services

These skills allow Copilot to execute external logic and return results directly into the user's Microsoft 365 experience.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384380-exam-ab-100-topic-1-question-6-discussion/>

005 Question.

You need to design a shared prompt library that will be used across multiple business units. The solution must meet the following requirements:

- Ensure consistent AI responses with reusable formats.
- Support governance and version control.
- Minimize administrative effort.
- Minimize ongoing costs.

What should you recommend for each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Ensure consistent AI responses:

- Delegate department-specific prompt templates.
- Define standardized prompt templates.
- Maintain a prompt history.

Support governance and version control:

- Define standardized prompt templates.
- Store prompts in a Git repository.
- Categorize prompts by business function.

Answer

Correct Answer:

Answer Area

Ensure consistent AI responses:

- Delegate department-specific prompt templates.
- Define standardized prompt templates.
- Maintain a prompt history.

Support governance and version control:

- Define standardized prompt templates.
- Store prompts in a Git repository.
- Categorize prompts by business function.

Explanation:

Ensure consistent AI responses: → **Define standardized prompt** templates Standardized templates give every business unit the same structure, tone, and expectations. This is the only option that guarantees consistent responses across teams.

Support governance and version control: → **Store prompts in a Git repository** - A Git repo provides: - Full version history - Branching and approvals - Governance workflows - Minimal cost (often free with existing DevOps/GitHub).

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384381-exam-ab-100-topic-1-question-7-discussion/>

006 Question.

A company has a Microsoft Foundry project that uses a single agent and a single prompt to complete a series of tasks.

- The agent encounters the following issues:
- It frequently produces incomplete results.
- It struggles with domain-specific reasoning.
- Agent response times are remarkably slow.

You need to recommend a solution to improve the overall performance and accuracy of the agent. What should you include in the recommendation? To answer, drag the appropriate actions to the correct requirements. Each action may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Actions

- Add a grounding data source.
- Add a prebuilt connector.
- Move to a multi-agent architecture.
- Upgrade to a larger generative AI model.

Answer Area**Action**

To improve performance:

To improve accuracy:

Answer

Correct Answer:**Actions**

-
- Add a prebuilt connector.
-
- Upgrade to a larger generative AI model.

Answer Area**Action**

To improve performance:

To improve accuracy:

Move to a multi-agent architecture.

Add a grounding data source.

Explanation:

To improve performance: → Move to a multi-agent architecture: A multi-agent architecture distributes tasks across specialized agents. This reduces cognitive load on a single model and dramatically improves speed, task completion, and parallelization.

To improve accuracy: → Add a grounding data source: Adding a grounding data source (Azure AI Search, SharePoint, Dataverse, etc.) gives the agent authoritative domain knowledge. This improves precision, reasoning, and completeness.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384382-exam-ab-100-topic-1-question-8-discussion/>

007 Question.

A financial services company uses Microsoft Dynamics 365 Finance.

Currently, the company's support staff manually reviews customer transaction histories to detect potential fraud cases before escalating the cases.

You need to recommend an automation solution for the review process. The solution must ensure that escalations reach a human analyst for final decision making. What should you recommend?

- A. Deploy an autonomous agent that closes non-fraud cases automatically.
- B. Use Microsoft 365 Copilot in Word to automatically finalize fraud detection policies.
- C. Configure a task agent to generate fraud risk scores for the human analyst to review.
- D. Export the data to a data lake for analysis in Microsoft Power BI.

Answer

Correct Answer: C

Explanation:

The company needs automation, but not full autonomy. The requirement explicitly states:

- Escalations must still reach a human analyst
- The system should assist, not replace, human decision-making
- The process involves structured, repeatable analysis (transaction review → risk scoring → human review)

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384383-exam-ab-100-topic-1-question-9-discussion/>

008 Question.

A company plans to deploy a Microsoft Copilot Studio agent that will analyze historical business data to predict customer behavior.

The data is currently stored in an Azure SQL database, flat files, APIs, and logs.

You need to organize the data into a format that can be used as a knowledge source in Copilot Studio.

What should you include in the solution?

- A. Azure AI Search
- B. Azure Data Lake Storage
- C. Azure Cosmos DB
- D. Azure Translator in Foundry Tools

Answer

Correct Answer: A

Explanation:

Azure AI Search is the correct choice. It's the only option in the list that can index, chunk, and vectorize heterogeneous data (SQL tables, flat files, APIs, logs) into a searchable knowledge source that Copilot Studio can ground its responses on.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384384-exam-ab-100-topic-1-question-10-discussion/>

009 Question.

A retail company plans to deploy Microsoft Copilot Studio agents to support: Microsoft Dynamics 365 Commerce scenarios.

A Microsoft Power Apps inventory management solution.

You need to recommend a solution to organize product catalog data as a consistent source for multiple AI systems.

What should you recommend?

- A. Let each agent scrape product details from Microsoft SharePoint Online libraries.
- B. Store the product catalog data in a separate custom table for each agent.
- C. Configure prompts to pull product details from the PDFs of external vendors.
- D. Centralize the product catalog data in Microsoft Dataverse and expose the data to both agents.

Answer

Correct Answer: D

Explanation:

Centralizing the catalog in Dataverse gives you a single source of truth that every Copilot Studio agent, Power Apps solution, and Dynamics 365 Commerce integration can reliably consume. This avoids duplication, drift, and inconsistent product attributes across systems.

Discussion: <https://www.examtactics.com/discussions/microsoft/view/384385-exam-ab-100-topic-1-question-11-discussion/>

010 Question.

A company has a portfolio of AI initiatives at different stages of development.

You need to recommend a structured approach to evaluating the return on AI investment (ROAI) across all the initiatives. The solution must balance immediate results with long-term values and strategic innovations.

What should you include in the recommendation?

- A. a simple cost and benefit analysis
- B. a horizon-based framework
- C. the internal rate of return (IRR) function
- D. a prioritization grid

Answer

Correct Answer: B

Explanation:

When a company has multiple AI initiatives at different maturity levels, you need a framework that:

- Evaluates short-term ROI
- Captures long-term strategic value
- Encourages innovation without ignoring immediate business impact
- Provides a structured, portfolio-level view

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384386-exam-ab-100-topic-1-question-12-discussion/>

011 Question.

You need to recommend a Microsoft Power Platform business solution that consolidates data from multiple internal and external data sources. The solution must meet the following requirements:

Provide the data as a centralized source for multiple AI systems, including Microsoft Copilot Studio agents, Dynamics 365 applications, and external AI models.

Support built-in data classification and protection policies.

Provide data for grounding and analytics.

What should you include in the recommendation?

- A. Microsoft Dataverse
- B. Azure Data Lake Storage
- C. a Microsoft Power BI semantic model
- D. Azure Cosmos DB

Answer

Correct Answer: A

Explanation:

You need a centralized, governed, secure data platform that can:

- Consolidate internal + external data sources
- Serve as a single source of truth for multiple AI systems
- Provide built-in data classification, DLP, and security
- Support grounding for Copilot Studio, Dynamics 365, and external AI models
- Enable analytics across the organization

Only Microsoft Dataverse satisfies all of these requirements.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384387-exam-ab-100-topic-1-question-13-discussion/>

012 Question.

A company plans to deploy an AI-based customer service app that will autonomously manage interactions, escalate complex cases, and learn from historical ticket data.

You need to perform a return on AI investment (ROAI) analysis of the app deployment. The solution must ensure that the analysis is accurate.

What should you do first?

- A. Establish the AI performance metrics.
- B. Conduct an AI market benchmarking study.

- C. Model the customer experience.
- D. Identify and quantify all the development, deployment, and operating costs.

Answer

Correct Answer: D

Explanation:

A Return on AI Investment (ROAI) analysis must begin with a baseline financial understanding. Before you can measure value, performance, or customer impact, you must know:

- What the AI solution will cost to build
- What it will cost to run
- What it will cost to maintain
- What existing processes cost today

Without this foundation, any ROI calculation would be incomplete or misleading.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384388-exam-ab-100-topic-1-question-14-discussion/>

013 Question.

You are designing end-to-end test scenarios for a business solution that uses Microsoft Dynamics 365 Sales and Dynamics 365 Finance.

You need to ensure that the business solution meets the following test requirements:

- Properly exchanges data between the Dynamics 365 apps
- Aligns with defined user workflows and business processes

Which type of testing should you use for each requirement? To answer, drag the appropriate testing types to the correct requirements. Each testing type may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Testing types

Drift

Exploratory

Integration

Performance

User acceptance

Answer Area

Properly exchanges data between the Dynamics 365 apps

Aligns with defined user workflows and business processes

Answer

Correct Answer:

Testing types

Drift

Exploratory

Performance

Answer Area

Properly exchanges data between the Dynamics 365 apps

Aligns with defined user workflows and business processes

Integration

User acceptance

Explanation:

→ **Integration testing** Integration testing validates that data flows correctly between **systems**—in this case, Dynamics 365 Sales and Dynamics 365 Finance. It ensures APIs, plugins, dual-write, and synchronization behave as expected.

→ **User acceptance testing (UAT)** User acceptance testing ensures the solution matches real-world business workflows, user expectations, and process requirements. It is the final validation before production.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406222-exam-ab-100-topic-1-question-15-discussion/>

014 Question.

A company has a Microsoft 365 tenant in Canada and multiple Microsoft Power Platform environments in Canada and the United States.

The company plans to deploy a Microsoft Copilot Studio agent to the Canadian environment that will use:

- Microsoft Dataverse data stored in Canada
- A connector that connects to an Azure OpenAI instance in the United States

You need to ensure that the agent adheres to data residency and data movement policies before being deployed.

What should you do?

- A. Ensure that the data processed by Azure OpenAI is stored in the United States.
- B. From the Microsoft Purview portal, validate the Data loss prevention settings.
- C. Migrate the tenant to the United States.
- D. Ensure that cross-region data movement is enabled for the Canadian environment and connector dependencies.

Answer

Correct Answer: d

Explanation:

Correct answer: D. Ensure that cross-region data movement is enabled for the Canadian environment and connector dependencies. Your Copilot Studio agent will run in Canada, but one of its dependencies—the Azure OpenAI connector—is located in the United States.

This means the agent will send data across regions, which triggers Microsoft's data residency and data movement policies.

Before deploying the agent, you must explicitly enable cross-region data movement for:

- The Canadian Copilot Studio environment
- The connector that calls Azure OpenAI in the U.S.

This is the only option that ensures the solution is compliant before deployment.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406223-exam-ab-100-topic-1-question-16-discussion/>

015 Question.

A company has a Microsoft Copilot Studio agent for customer support.

You are reviewing and validating the following prompts:

- A prompt that has instructions to "help the customer as best you can"
- A prompt that helps retrieve product information from a knowledge base

You need to ensure that the agent delivers consistent and accurate responses.

What should you do for each prompt? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

A prompt that has instructions to "help the customer as best you can":

Add filler words to make the prompt sound more natural and conversational.
Keep the prompt vague to enable model flexibility.
Rewrite the prompt with clear and task-specific instructions.

A prompt that helps retrieve product information from a knowledge base:

Add several open-ended questions to give the model broader context.
Use responses with only reference sources and limit the response scope.
Remove the knowledge source so that the model responds freely with general product information.

Answer

Correct Answer:

Answer Area

A prompt that has instructions to "help the customer as best you can":

Add filler words to make the prompt sound more natural and conversational.
Keep the prompt vague to enable model flexibility.
Rewrite the prompt with clear and task-specific instructions.

A prompt that helps retrieve product information from a knowledge base:

Add several open-ended questions to give the model broader context.
Use responses with only reference sources and limit the response scope.
Remove the knowledge source so that the model responds freely with general product information.

Explanation:

Prompt: "help the customer as best you can" → Rewrite the prompt with clear and task-specific instructions.

A vague instruction like "help the customer as best you can" leads to inconsistent, unpredictable model behavior. Clear, scoped, task-specific instructions produce repeatable, controlled, and aligned responses

Prompt: Retrieve product information from a knowledge base → Use responses with only reference sources and limit the response scope.

- When grounding to a knowledge base, the model must:
- Stay within the retrieved content - Avoid hallucinating
- Cite or reference the source
- Limit the scope to the product information retrieved

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406224-exam-ab-100-topic-1-question-17-discussion/>

016 Question.

You are designing a testing solution for Microsoft Copilot Studio agents.

You need to validate prompt engineering best practices to ensure that the agents generate accurate and contextually relevant responses.

Which prompt validation techniques and metrics should you include in the solution? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Prompt validation techniques:

Exclude domain-specific terminology from the prompts.
Use prompts that have varied phrasing.
Use only simple, one-word prompts.

Metrics:

The number of words generated per response
Response relevance and accuracy
The response generation time

Answer

Correct Answer:

Answer Area

Prompt validation techniques:

Exclude domain-specific terminology from the prompts.
Use prompts that have varied phrasing.
Use only simple, one-word prompts.

Metrics:

The number of words generated per response
Response relevance and accuracy
The response generation time

Explanation:

Prompt validation techniques: → **Use prompts that have varied phrasing** This is the correct technique because varied phrasing helps you test whether the agent responds consistently even when users express the same intent in different ways. It validates robustness, generalization, and prompt stability.

Metrics: → **Response relevance and accuracy** This is the key metric for evaluating whether the agent is producing correct, contextually grounded, and useful responses. It directly measures the success of prompt engineering.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406225-exam-ab-100-topic-1-question-18-discussion/>

017 Question.

A company has two Microsoft Power Platform environments named Dev1 and Prod1. A Microsoft Copilot Studio agent named Agent1 is built into a solution in the Dev1 environment.

You plan to deploy Agent1 to Prod1.

You need to make Agent1 available to the users in Prod1. The solution must minimize administrative effort.

What should you do?

- A. Share Agent1 with the users in Prod1.
- B. Export the solution as an unmanaged solution and import the solution into Prod1.
- C. Export the solution as a managed solution and import the solution into Prod1.
- D. Create a new Copilot Studio agent in Prod1 by replicating the configuration of Agent1.

Answer

Correct Answer: C

Explanation:

The correct answer is: C. Export the solution as a managed solution and import the solution into Prod1.

To move a Copilot Studio agent (or any Power Platform component) from Dev to Prod, the recommended and lowest-effort approach is:

- Package the agent inside a managed solution
- Import that managed solution into Prod1 This ensures:
- Proper ALM (Application Lifecycle Management)
- Controlled, locked-down components in production
- Easy updates through solution versioning
- Minimal administrative overhead
- No need to manually recreate or re-share anything

This is exactly how Microsoft expects Copilot Studio agents to be deployed across environments.

Discussion: <https://www.examtopycs.com/discussions/microsoft/view/406226-exam-ab-100-topic-1-question-19-discussion/>

018 Question.

A company has a Microsoft Power Platform environment that contains Microsoft Dataverse data.

You create a Microsoft Copilot Studio agent named Agent1 that processes the Dataverse data.

You discover that Agent1 fails to return relevant or accurate results.

You need to improve the quality and reliability of data grounding.

What should you do?

- A. Retrain Agent1.
- B. Verify and cleanse the Dataverse data.
- C. Use an adaptive card in Agent1.
- D. Add example user inputs to the training data of Agent1.

Answer

Correct Answer: B

Explanation:

The right first step is B. Verify and cleanse the Dataverse data.

When a Copilot Studio agent returns irrelevant or inaccurate results, the most common root cause is poor grounding data quality. Grounding only works if the underlying Dataverse tables contain:

- Clean
- Complete
- Accurate
- Well-structured information.

If the data is inconsistent, outdated, duplicated, or missing key fields, the agent will hallucinate or produce unreliable answers—even if the prompts and model are correct.

So before retraining, rewriting prompts, or adding examples, you must fix the data.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406227-exam-ab-100-topic-1-question-20-discussion/>

019 Question.

A company plans to deploy a Microsoft Copilot Studio agent to enhance customer support.

The company stores customer data across ServiceNow, Microsoft Dynamics 365 Finance, Dynamics 365 Supply Chain Management, and Excel files in SharePoint Online.

You need to recommend a solution to ensure that the agent can deliver accurate and timely responses.

What should you recommend?

- A. Implement a model router for query handling.
- B. Create custom prompts.
- C. Implement Microsoft Power Platform connectors.
- D. Enable incremental indexing in Azure AI Search.

Answer

Correct Answer: C

Explanation:

The correct recommendation is: C. Implement Microsoft Power Platform connectors.

Power Platform connectors allow the agent to securely and reliably access each system's data without custom integration work. This ensures:

- Real-time data retrieval
- Consistent grounding

- Minimal development effort
- Compliance with Power Platform governance
- Seamless integration across all systems

Discussion: <https://www.examtactics.com/discussions/microsoft/view/406228-exam-ab-100-topic-1-question-21-discussion/>

020 Question.

A manufacturing company wants to deploy an agent that will automate supplier invoice processing.

You are designing a solution to evaluate the financial implications of the deployment. The company is especially concerned about budget overruns.

You need to ensure that the solution considers the total cost of ownership (TCO), the expected savings from using automation, and whether to extend the existing AI capabilities.

What should you include in the design?

- A. a break-even analysis only
- B. adopting prebuilt agents to reduce the deployment time
- C. training a custom model
- D. a return on AI investment (ROAI) analysis

Answer

Correct Answer: D

Explanation:

The correct answer is: D. a return on AI investment (ROAI) analysis

The company wants to evaluate:

- Total cost of ownership (TCO)
- Expected savings from automation
- Whether extending AI capabilities is financially justified
- Risk of budget overruns

A return on AI investment (ROAI) analysis is the only framework that covers all of these dimensions.

Discussion: <https://www.examtactics.com/discussions/microsoft/view/406229-exam-ab-100-topic-1-question-22-discussion/>

021 Question.

A company has a Microsoft Power Platform solution that contains the following components:

- Microsoft Dataverse tables
- A Microsoft Power BI workspace named WS1
- A canvas app named App1 that uses Dataverse
- A Power BI semantic model that connects to Dataverse by using DirectQuery

You plan to use generative AI to provide answers to queries based on a subset of corporate data.

You need to ensure that the data is available as a grounding data source for AI systems.

What should you do?

- A. Populate a Dataverse table.
- B. Share WS1.
- C. Endorse the semantic model.
- D. Export the semantic model.

Answer

Correct Answer: A

Explanation:

The correct answer is: A. Populate a Dataverse table.

To make data available as a grounding data source for generative AI systems (including Copilot Studio, Microsoft 365 Copilot, and other AI experiences), the data must live in a supported grounding store. From the options provided, the only store that AI systems can directly ground on is:

Microsoft Dataverse The scenario already includes Dataverse, so the correct action is to populate a Dataverse table with the subset of corporate data you want to expose to AI.

Discussion: <https://www.examtips.com/discussions/microsoft/view/406230-exam-ab-100-topic-1-question-23-discussion/>

022 Question.

A company plans to implement an AI business solution for a consumer goods company.

You need to create agents that meet the following requirements:

- Orchestrate the sales order fulfillment and shipping of goods to customers.
- Analyze historical data and trends to replenish stock.

Which type of agent should you use for each requirement? To answer, drag the appropriate agent types to the correct requirements. Each agent type may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Agent types	Answer Area
Autonomous	Orchestrate the sales order fulfillment and shipping:
Prompt-and-response	Analyze historical data and trends:
Task	

Answer

Correct Answer:

Agent types	Answer Area
	Orchestrate the sales order fulfillment and shipping: Autonomous
Prompt-and-response	Analyze historical data and trends: Task

Explanation:

Orchestrate the sales order fulfillment and shipping → Autonomous agent

This scenario requires an agent that can coordinate multi-step workflows, make decisions, trigger actions across systems, and manage an end-to-end operational process.

That is exactly what an autonomous agent is designed for.

Analyze historical data and trends to replenish stock → Task agent

Task agents are built for bounded, well-defined analytical or computational tasks, not ongoing orchestration.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406231-exam-ab-100-topic-1-question-24-discussion/>

023 Question.

A company has an AI agent that automates the review of customer feedback stored in a cloud database.

You plan to generate monthly reports from the agent's output to provide insights into customer sentiment and guide product development and marketing.

You need to ensure that the data ingested by the agent is clean and suitable for the intended use.

What should you do to prepare the data?

- A. Create a workflow in Microsoft Power Automate.
- B. Identify and address biased data.
- C. Create an agent flow in Microsoft Copilot Studio.
- D. Sort the database by customer last name.

Answer

Correct Answer: B

Explanation:

The correct answer is B. Identify and address biased data. Before generating monthly sentiment reports, the company must ensure that the customer feedback data is clean, representative, and free of bias. This is a core requirement in responsible AI and data preparation. This step is explicitly emphasized in Microsoft's AI readiness and data preparation guidance.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406232-exam-ab-100-topic-1-question-25-discussion/>

024 Question.

A company is designing a Microsoft Power Platform solution to reduce the manual steps of a business process by deploying an existing AI model.

You need to calculate the return on AI investment (ROAI) by identifying the metadata and telemetry of the solution.

What should you use?

- A. Microsoft Power Platform admin center
- B. Success by Design
- C. the Business value toolkit
- D. Microsoft Cloud Adoption Framework for Azure

Answer

Correct Answer: C

Explanation:

The correct answer is: C. the Business value toolkit The Business value toolkit is the only Microsoft tool designed specifically to:

- Capture telemetry and metadata from Power Platform solutions
- Model ROI and ROAI
- Estimate TCO
- Quantify expected savings
- Support build vs buy vs extend decisions
- Provide financial modeling templates for AI adoption

Discussion: <https://www.examtactics.com/discussions/microsoft/view/406233-exam-ab-100-topic-1-question-26-discussion/>

025 Question.

A company has a Microsoft Power Platform environment.

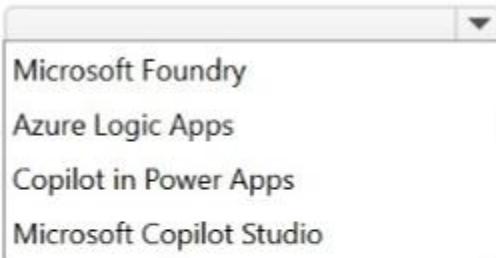

You need to build two agents named Agent1 and Agent2. The solution must meet the following requirements:

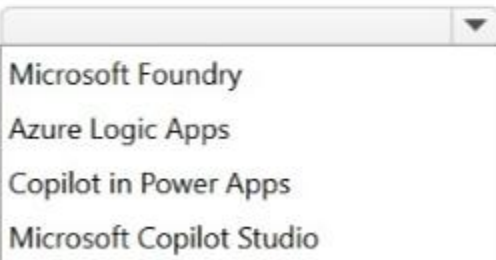

- Agent1 must be extendable by using the Semantic Kernel and must connect to multiple business apps and APIs.
- Agent2 must connect directly to data stored in Microsoft Dataverse and must be embeddable in a Microsoft Power Apps canvas app.

What should you use to build each agent? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Agent1: 

Agent2: 

Answer

Correct Answer:

Explanation:

Agent1 → Microsoft Foundry Agent1 must:

- Be extendable using Semantic Kernel
- Connect to multiple business apps and APIs
- Support complex orchestration and multi-agent patterns

These are exactly the capabilities of Microsoft Foundry, which is designed for enterprise-grade, extensible, multi-agent AI systems with deep integration into Semantic Kernel.

Agent2 → Copilot in Power Apps Why: Agent2 must:

- Connect directly to Dataverse
- Be embeddable in a Power Apps canvas app

This is precisely what Copilot in Power Apps is built for.

Discussion: <https://www.examtopycs.com/discussions/microsoft/view/406234-exam-ab-100-topic-1-question-27-discussion/>

026 Question.

A company has an Azure environment that supports multiple business units.

The company plans to implement an AI solution that will perform sentiment analysis on customer product reviews.

You need to evaluate the potential cost of the solution to support return on AI investment (ROAI) analysis.

What should you use?

- A. Cost Management + Billing
- B. Microsoft Fabric SKU Estimator
- C. Total Cost of Ownership (TCO) Calculator
- D. Azure Reservations

Answer

Correct Answer:

Explanation:

A. Cost Management + Billing To evaluate the potential cost of an AI solution running in Azure — especially for ROAI (Return on AI Investment) — you need visibility into:

- Current Azure resource consumption
- Forecasted costs
- Cost trends
- Service-level spending
- Budget alerts
- Cost allocation by business unit

Cost Management + Billing is the Azure-native tool that provides exactly this.

Discussion: <https://www.examtopycs.com/discussions/microsoft/view/406235-exam-ab-100-topic-1-question-28-discussion/>

027 Question.

You need to recommend a Microsoft Power Platform solution for customer support. The solution must include AI capabilities in Microsoft Power Automate and must meet the following requirements:

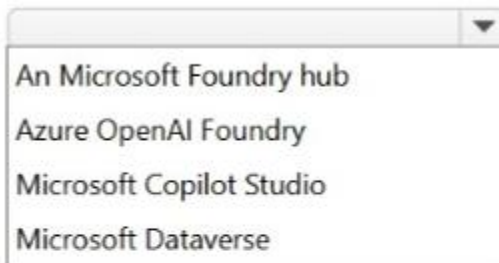

- Use a centralized workspace for AI models.
- Generate short overviews from large amounts of unstructured text, such as case notes or transcripts, without requiring additional training or coding.

What should you include in the recommendation for each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

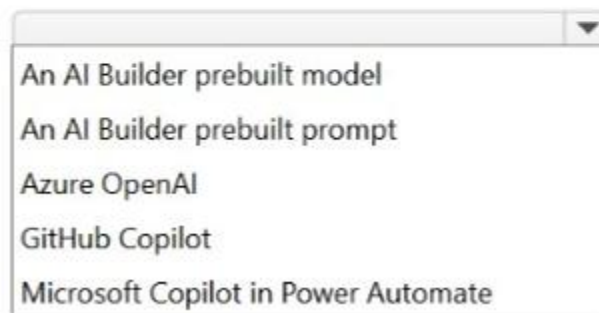

Answer Area

Use a centralized workspace:

An Microsoft Foundry hub
Azure OpenAI Foundry
Microsoft Copilot Studio
Microsoft Dataverse

Generate short overviews:

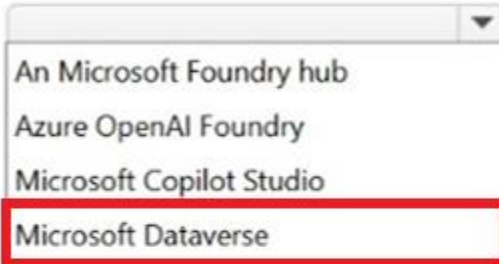

An AI Builder prebuilt model
An AI Builder prebuilt prompt
Azure OpenAI
GitHub Copilot
Microsoft Copilot in Power Automate

Answer

Correct Answer:

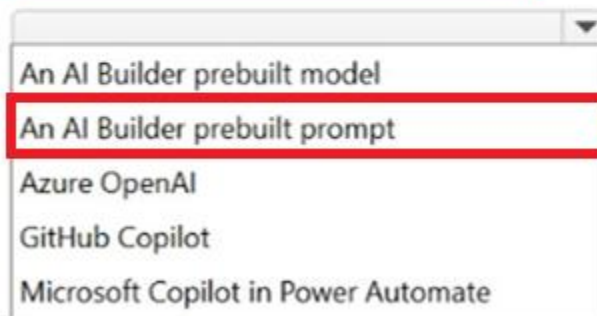

Answer Area

Use a centralized workspace:

An Microsoft Foundry hub
Azure OpenAI Foundry
Microsoft Copilot Studio
Microsoft Dataverse

Generate short overviews:

An AI Builder prebuilt model
An AI Builder prebuilt prompt
Azure OpenAI
GitHub Copilot
Microsoft Copilot in Power Automate

Explanation:

Use a centralized workspace → Microsoft Dataverse In Power Platform, the AI Hub is built on Dataverse and acts as the centralized workspace for:

- Managing AI models
- Managing AI Builder models
- Managing prompts
- Managing AI assets used in Power Automate and Power Apps

Neither Foundry option is part of Power Platform, and Copilot Studio is for agents, not centralized AI model management.

Generate short overviews → AI Builder prebuilt prompt The requirement is:

- Generate short overviews
- From large unstructured text (case notes, transcripts)
- Without training
- Without coding

This is exactly what AI Builder prebuilt prompts are designed for.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406236-exam-ab-100-topic-1-question-29-discussion/>

028 Question.

Body A company uses Microsoft Dynamics 365 Finance for accounts payable and customer debt recovery.

You are designing an AI finance process that meets the following requirements:

- Provides AI-driven details to help staff identify overdue vendor invoices and outstanding balances
- Helps staff reduce how long it takes to review overdue invoices and payment history

You need to recommend which Microsoft Copilot features to include in the design.

What should you recommend for each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Help identify vendor overdue invoices and outstanding balances:

Agent management
AI Summaries with Copilot
The Account Reconciliation agent
The Supplier Communication agent

Reduce how long it takes to review overdue invoices and payment history:

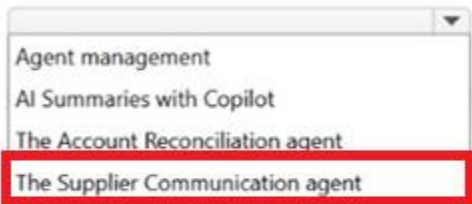

Analyze demand plans with Copilot
Collections coordinator summary
The Account Reconciliation agent
The Supplier Communication agent

Answer

Correct Answer:

Answer Area

Help identify vendor overdue invoices and outstanding balances:

A screenshot of a dropdown menu. The menu is open, showing four options: 'Agent management', 'AI Summaries with Copilot', 'The Account Reconciliation agent', and 'The Supplier Communication agent'. The last option, 'The Supplier Communication agent', is highlighted with a red rectangular border.

Reduce how long it takes to review overdue invoices and payment history:

A screenshot of a dropdown menu. The menu is open, showing four options: 'Analyze demand plans with Copilot', 'Collections coordinator summary', 'The Account Reconciliation agent', and 'The Supplier Communication agent'. The second option, 'Collections coordinator summary', is highlighted with a red rectangular border.

Explanation:

1. Help identify vendor overdue invoices and outstanding balances → The Supplier Communication agent This agent is designed for vendor-facing processes in Dynamics 365 Finance.

- Identify overdue vendor invoices
- Track outstanding balances
- Communicate with suppliers
- Automate follow-ups

2. Reduce how long it takes to review overdue invoices and payment history → Collections coordinator summary The Collections Coordinator Copilot feature provides:

- AI-generated summaries of customer payment history
- Overdue invoice insights
- Quick review of aging and collection status
- Faster decision-making for debt recovery

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406237-exam-ab-100-topic-1-question-30-discussion/>

029 Question.

A company has an AI agent that automates the review of customer feedback stored in a cloud database.

You plan to generate monthly reports from the agent's output to provide insights into customer sentiment and guide product development and marketing.

You need to ensure that the data ingested by the agent is clean and suitable for the intended use.

What should you do to prepare the data?

- A. Ensure that the size of the database does not exceed 100 GB.
- B. Translate the data into a single language.
- C. Identify and address biased data.
- D. Sort the database by customer last name.

Answer

Correct Answer: C

Explanation:

The correct answer is C. Identify and address biased data.

For an AI agent performing sentiment analysis on customer feedback, the most important data-quality step is ensuring that the dataset is:

- Representative
- Unbiased
- Fair
- Suitable for downstream analytics

Discussion: <https://www.examttopics.com/discussions/microsoft/view/411611-exam-ab-100-topic-1-question-33-discussion/>

030 Question.

A company has an Azure environment that supports multiple business units.

The company plans to implement an AI solution that will perform sentiment analysis on customer product reviews.

You need to evaluate the potential cost of the solution to support return on AI investment (ROAI) analysis.

What should you use?

- A. Total Cost of Ownership (TCO) Calculator
- B. Azure Reservations
- C. Azure pricing calculator
- D. Azure Monitor

Answer

Correct Answer: C

Explanation:

C. Azure pricing calculator To evaluate the potential cost of a new AI workload — before deployment — you need a tool that can:

- Estimate the cost of Azure services you plan to use
- Model different configurations
- Forecast monthly and annual spend
- Support early-stage ROAI calculations

The Azure pricing calculator is specifically designed for pre-deployment cost estimation.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/411612-exam-ab-100-topic-1-question-34-discussion/>

031 Question.

A company has an Azure environment that supports multiple business units.

The company plans to implement an AI solution that will perform sentiment analysis on customer product reviews.

You need to evaluate the potential cost of the solution to support return on AI investment (ROAI) analysis.

What should you use?

- A. Azure savings plans
- B. Microsoft Fabric SKU Estimator
- C. Cost Management + Billing
- D. Azure Monitor

Answer

Correct Answer: C

Explanation:

Correct Answer: Cost Management + Billing To evaluate potential cost for an AI workload (sentiment analysis on product reviews) across multiple business units, you need:

- Forecasted Azure spend
- Cost breakdown by resource, tag, or business unit
- Budget alerts
- Usage analytics
- Chargeback/showback support

Cost Management + Billing is the only option that provides all of this. It is specifically used for ongoing and projected Azure cost analysis, which is essential for ROAI.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/411613-exam-ab-100-topic-1-question-35-discussion/>

032 Question.

A company has an Azure environment that supports multiple business units.

The company plans to implement an AI solution that will perform sentiment analysis on customer product reviews.

You need to evaluate the potential cost of the solution to support return on AI investment (ROAI) analysis.

What should you use?

- A. Azure Reservations
- B. Microsoft Fabric SKU Estimator
- C. Anomaly Detection in Azure Cost Management
- D. Azure pricing calculator

Answer

Correct Answer: D

Explanation:

Azure pricing calculator.

To evaluate the potential cost of a new AI workload (sentiment analysis on product reviews), you need a tool that:

- Estimates future Azure service costs
- Models different configurations (compute, storage, AI services)
- Supports pre-deployment ROAI calculations
- Works across multiple business units

The Azure pricing calculator is the only option designed specifically for forecasting the cost of planned Azure services before you deploy anything. This is exactly what ROAI requires.

Discussion: <https://www.examtopycs.com/discussions/microsoft/view/411614-exam-ab-100-topic-1-question-36-discussion/>

033 Question.

You need to design a Microsoft 365 Copilot solution to optimize employee productivity. The solution must meet the following requirements:

Ensure that the employees can query content stored in a subset of Microsoft SharePoint Online sites and in Teams by using natural language-based prompt actions.

Ensure that employees receive contextually relevant responses in Microsoft 365 Copilot.

What should you include in the design?

- A. Build a Microsoft Power Automate desktop flow to read the SharePoint content and post the responses to Teams.
- B. Modify SharePoint settings.
- C. Create a custom REST API that crawls the SharePoint content.
- D. Configure Microsoft Graph access.

Answer

Correct Answer: D

Explanation:

To let Microsoft 365 Copilot query specific SharePoint Online sites and Teams content using natural language—and return contextually grounded responses—you must configure Microsoft Graph access. This is the mechanism Copilot uses to read organizational content securely and selectively.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384392-exam-ab-100-topic-2-question-4-discussion/>

034 Question.

A company uses Microsoft Dynamics 365 Finance to manage accounts payable.

You are designing an AI invoice processing solution.

You need to recommend the prerequisites to configure a prebuilt copilot for accounts payable.

What should you recommend?

- A. From Microsoft Copilot Studio, create an accounts payable agent.
- B. Extend Microsoft 365 Copilot for Sales to an accounts payable agent.
- C. Build an AI tool in Microsoft Foundry.
- D. From the Power Platform admin center, assign the Finance and Operations AI security role to users.

Answer

Correct Answer: D

Explanation:

To enable the prebuilt Copilot for Accounts Payable in Dynamics 365 Finance, users must be assigned the Finance and Operations AI security role. This is the documented prerequisite before the AP Copilot can access invoice data and perform AI-assisted processing.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384393-exam-ab-100-topic-2-question-5-discussion/>

035 Question.

A company plans to deploy a Microsoft Dynamics 365 Contact Center agent.

You need to ensure that the agent can transfer the conversation to a live customer service representative.

Which two components should you include in the solution? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Microsoft Foundry
- B. Microsoft Copilot Studio
- C. Microsoft 365 Agents Toolkit
- D. an Azure AI Bot Service skill
- E. Customer engagement hub

Answer

Correct Answer: BE

B. Microsoft Copilot Studio Dynamics 365 Contact Center uses Copilot Studio to build and configure the conversational agent. The live-agent transfer capability is implemented through:

- handoff nodes
- Omnichannel/Customer Service integration
- routing rules

E. Customer engagement hub The Customer Service workspace / Customer Engagement Hub is where human agents receive escalated conversations. The Contact Center agent must be able to:

- transfer the session to a queue
- route it to a human agent
- allow the human agent to pick up the conversation in the Customer Engagement Hub

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384394-exam-ab-100-topic-2-question-6-discussion/>

036 Question.

A company uses Microsoft Dynamics 365 Supply Chain Management.

You are designing an AI supply chain process that meets the following requirements:

Provides managers with AI-driven insights that surface key information from customer orders

Helps planners use AI to anticipate future product needs more accurately

You need to recommend which Microsoft Copilot features to include in the design.

What should you recommend for each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Provide AI-driven insights from customer orders:

AI Summaries with Copilot
Generative insights for Demand planning
The Customer credit and collections workspace
Workload insights with Copilot

Anticipate future product needs:

Generative insights for Demand planning
Microsoft Power BI
Product information management
The Supplier Communications Agent

Answer

Correct Answer:

Answer Area

Provide AI-driven insights from customer orders:

AI Summaries with Copilot
Generative insights for Demand planning
The Customer credit and collections workspace
Workload insights with Copilot

Anticipate future product needs:

Generative insights for Demand planning
Microsoft Power BI
Product information management
The Supplier Communications Agent

Explanation:

1. Provide AI-driven insights from customer orders: → AI Summaries with Copilot

Reason: AI Summaries in Supply Chain Management surface key information from operational records—such as customer orders, shipments, delays, exceptions, and fulfillment issues. They are designed to give managers quick, AI-generated overviews of order activity.

2. Anticipate future product needs: → Generative insights for Demand planning

Reason: This Copilot feature uses AI to analyze historical demand, seasonality, supply constraints, and forecast signals to help planners predict future product needs more accurately.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384395-exam-ab-100-topic-2-question-7-discussion/>

037 Question.

A company has a Microsoft 365 E5 subscription and uses Microsoft Copilot Studio. The company has a Microsoft SharePoint Online library that contains 10,000 policy PDFs from various departments. The library contains a populated column named Department for each PDF. You need to design a Copilot Studio agent that will use the SharePoint library as a knowledge source. The solution must meet the following requirements:

- Enable the agent to answer user questions about company policies.
- Ensure that the agent can identify which departments and policies are connected.

What should you include in the design for each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Enable the agent to answer questions about company policies:

- Build a custom model in Microsoft Foundry.
- From Copilot Studio, add SharePoint as a knowledge source.
- Import the PDFs into Microsoft Dataverse.
- Use AI Builder to process and feed SharePoint content.

Identify which departments and policies are connected:

- Apply Microsoft Purview sensitivity labels.
- Create a Microsoft Dataverse table for the departments.
- From Copilot Studio, configure the SharePoint tool.
- Upgrade to SharePoint Premium.

Answer

Correct Answer:

Answer Area

Enable the agent to answer questions about company policies:

- Build a custom model in Microsoft Foundry.
- From Copilot Studio, add SharePoint as a knowledge source.
- Import the PDFs into Microsoft Dataverse.
- Use AI Builder to process and feed SharePoint content.

Identify which departments and policies are connected:

- Apply Microsoft Purview sensitivity labels.
- Create a Microsoft Dataverse table for the departments.
- From Copilot Studio, configure the SharePoint tool.
- Upgrade to SharePoint Premium.

Explanation:

1. From Copilot Studio, add SharePoint as a knowledge source.

Copilot Studio can directly index a SharePoint library (including PDFs) as a knowledge source, enabling natural-language Q&A over the content. No custom models, Dataverse imports, or AI Builder pipelines are required.

2. Create a Microsoft Dataverse table for the departments.

The agent must understand relationships between departments and policies. - A Dataverse table allows you to: - Represent departments as structured entities - Link policies to departments - Enable the agent to reason over relationships (e.g., “Which policies belong to HR?”)

Discussion: <https://www.examtopycs.com/discussions/microsoft/view/384527-exam-ab-100-topic-2-question-8-discussion/>

038 Question.

You need to design a Microsoft Copilot Studio agent that meets the following requirements:

Supports interactive speech responses

Optimizes decision-making and the accuracy of responses

What should you include in the design for each requirement? To answer, drag the appropriate options to the correct requirements. Each option may be used once, more than once, or not at all.

You may need to drag the split bar between panes or scroll to view content.

Options	Answer Area	Option
A deep reasoning model	Supports interactive speech responses:	
Azure Language in Foundry Tools	Optimizes decision-making and response accuracy:	
Azure AI Speech		
Copilot Studio voice features		
Speech Synthesis Markup Language (SSML)		

Answer

Correct Answer:

Options	Answer Area	Option
	Supports interactive speech responses:	Copilot Studio voice features
Azure Language in Foundry Tools	Optimizes decision-making and response accuracy:	A deep reasoning model
Azure AI Speech		
Speech Synthesis Markup Language (SSML)		

Explanation:

Copilot Studio voice features → Interactive speech responses

Copilot Studio includes built-in voice capabilities that allow an agent to:

- Listen to user speech
- Generate spoken responses
- Support natural, interactive voice conversations

This is the only option designed specifically for speech interaction.

Deep reasoning model → Decision-making & accuracy

Deep reasoning models (like GPT-4-class reasoning models) are used in Copilot Studio to:

- Improve multi-step reasoning
- Increase accuracy of responses
- Handle complex decision logic
- Produce more reliable, grounded answers

This directly satisfies the requirement to optimize decision-making and accuracy.

Discussion: <https://www.examtopycs.com/discussions/microsoft/view/384070-exam-ab-100-topic-2-question-9-discussion/>

039 Question.

You are designing a low-code AI business solution by using Microsoft Copilot Studio.

The solution must include an agent that automates tasks by simulating user interactions across third-party apps and websites, such as clicking buttons, entering text, and extracting information from screens.

You need to recommend what to include in the agent.

What should you recommend?

- A. Model Context Protocol (MCP)
- B. a natural language understanding + (NLU+) model in Copilot Studio
- C. Computer Use in Copilot Studio
- D. Copilot skills

Answer

Correct Answer: C

Explanation:

Computer Use enables a Copilot Studio agent to:

- Control a computer like a human
- Click, type, scroll, select, and navigate
- Read information from screens
- Automate workflows across any app (web or desktop)
- Handle UI automation without building custom connectors It is the low-code way to give your agent real “hands-on-keyboard” abilities.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384396-exam-ab-100-topic-2-question-10-discussion/>

040 Question.

You need to recommend a solution to integrate a Microsoft Copilot agent with a Microsoft Dynamics 365 Contact Center chat channel.

The agent must respond to customer questions and hand off the conversation to a live customer service representative when the customer requests an escalation.

What should you recommend?

- A. Build an agent flow.
- B. Configure the Conversation Start topic.
- C. Configure a skill.
- D. Call a Microsoft Power Automate connector.
- E. Configure the Escalate topic.

Answer

Correct Answer: E

Explanation:

In Copilot Studio, the Escalate topic is the built-in mechanism that:

- Detects when a customer asks for a human
- Triggers the handoff flow
- Connects to Dynamics 365 Customer Service / Contact Center queues
- Transfers the conversation to a live representative

This is the only option that directly supports the required escalation behavior.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384397-exam-ab-100-topic-2-question-11-discussion/>

041 Question.

A company has a customer order system that creates sales orders manually.

You need to design an AI solution to automate the following tasks as part of the system:

Save the order details to a database.

Update the order status in the database.

Extract the order details from an order file.

Prepare and send a confirmation email to customers.

The solution must minimize development effort and support intelligent automation and solution integration.

What should you include in the design?

- A. a workflow in Azure Logic Apps
- B. a multi-agent solution that uses the Semantic Kernel SDK
- C. a multi-agent solution that uses Microsoft Foundry Agent Service
- D. a Microsoft Copilot Studio agent that uses Microsoft Power Automate workflows

Answer

Correct Answer: D

Explanation:

D. A Microsoft Copilot Studio agent that uses Microsoft Power Automate workflows. Your requirements are:

- Save order details to a database
- Update order status
- Extract order details from an order file
- Prepare and send confirmation emails
- Minimize development effort
- Support intelligent automation
- Support integration across systems

This is a textbook case for Copilot Studio + Power Automate.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384398-exam-ab-100-topic-2-question-12-discussion/>

042 Question.

You are designing an AI strategy for Microsoft Dynamics 365 finance and operations apps. You are evaluating the use of Microsoft Copilot Studio to provide in-app help and guidance based on generative AI general knowledge.

You need to recommend which knowledge sources to include in the generative help and guidance agent. The solution must minimize the risk of generating inaccurate responses.

What should you recommend? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Custom knowledge sources:

- Must be uploaded to the agent
- Must be excluded from the agent
- Are not supported

AI general knowledge:

- Must be enabled for the agent
- Must be disabled for the agent
- Is not supported

Answer

Correct Answer:

Answer Area

Custom knowledge sources:

- Must be uploaded to the agent
- Must be excluded from the agent
- Are not supported

AI general knowledge:

- Must be enabled for the agent
- Must be disabled for the agent
- Is not supported

Explanation:

1. Custom knowledge sources → Must be uploaded to the agent To minimize hallucinations, Copilot Studio agents used for in-app help and guidance in Dynamics 365 must rely on trusted, organization-controlled content. This includes: - Product documentation - Internal process guides - Policy documents - Standard operating procedures
2. AI general knowledge → Must be disabled for the agent General knowledge models can introduce: - Hallucinations - Non-compliant or inaccurate answers - Content unrelated to Dynamics 365 processes

Discussion: <https://www.examtips.com/discussions/microsoft/view/384054-exam-ab-100-topic-2-question-13-discussion/>

043 Question.

You need to design a multi-agent solution that will include a custom agent. The solution must meet the following requirements:

Define the rules and constraints that the agent must follow.

Automate a backend process that involves data movement between services and runs

independently of the agent's reasoning steps.

What should you include in the design for each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Define rules and constraints:

Agent flows
Conversation topics
Microsoft Power Automate cloud flow

Automate a backend process:

Conversation topics
Microsoft Power Automate cloud flow
Microsoft Power Pages

Answer

Correct Answer:

Answer Area

Define rules and constraints:

Agent flows
Conversation topics
Microsoft Power Automate cloud flow

Automate a backend process:

Conversation topics
Microsoft Power Automate cloud flow
Microsoft Power Pages

Explanation:

1. Rules and constraints → Agent flows Agent flows are the mechanism used in Copilot Studio to:

- Define policies, constraints, and guardrails
- Control how the agent reasons
- Enforce rules such as allowed actions, restricted topics, or required steps

- Shape the agent's decision-making and behavior They are part of the agent's internal orchestration, not external automation.

2. Backend automation → Power Automate cloud flow A backend process that:

- Moves data between services
- Runs independently of the agent's reasoning
- Executes reliably and asynchronously

Is exactly what Power Automate cloud flows are designed for.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384399-exam-ab-100-topic-2-question-14-discussion/>

044 Question.

You are designing a Microsoft Copilot Studio agent that uses a custom Microsoft Foundry model to generate responses.

You need to ensure that the agent can securely connect to and invoke the custom model during user interactions.

What should you include in the design?

- Configure the agent to use classic orchestration.
- Create a connection to Microsoft Foundry in the agent.
- Add the Microsoft Foundry model as a Copilot Studio skill.
- Create a custom engine agent.

Answer

Correct Answer: B

Explanation:

The key requirement in your scenario is securely connecting a Copilot Studio agent to a custom Microsoft Foundry model so the agent can invoke it during user interactions. That capability is enabled through connections, not orchestration modes, skills, or custom engine agents. To securely invoke a custom Microsoft Foundry model from a Copilot Studio agent, you must create a Foundry connection inside the agent.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384404-exam-ab-100-topic-3-question-4-discussion/>

045 Question.

You need to design an application lifecycle management (ALM) process for a Microsoft Power Platform environment that contains a solution named Solution1.

Solution1 must include a custom connector for Copilot in Microsoft Dynamics 365 Customer Service. Solution1 must meet the following requirements:

- Ensure that the custom connector can be deployed consistently across environments as part of the ALM process.
- Allow the custom connector to be edited only in the development environment.

What should you include in the design?

- A. Add the custom connector to GitHub.
- B. Share the custom connector.
- C. Create the custom connector in the default solution.
- D. Add the custom connector to Solution1.

Answer

Correct Answer: D

Explanation:

Custom connectors must be included inside a solution so they can be:

- exported from Dev
- -imported into Test/Prod
- versioned and transported through pipelines

When a solution is exported as managed, all components—including the custom connector—become:

- locked
- read-only
- not editable in Test/Prod

Discussion: <https://www.examtopycs.com/discussions/microsoft/view/406240-exam-ab-100-topic-2-question-18-discussion/>

046 Question.

A company uses a Microsoft Copilot Studio agent to automate tasks in a web app.

During testing, you discover that the automation sometimes fails because of frequent changes to the app's user interface.

You need to recommend a solution to ensure that the agent successfully automates the tasks. The solution must minimize changes to the agent.

What should you include in the recommendation?

- A. Computer Use in Copilot Studio

- B. custom models in Azure AI Studio
- C. conversation topics in Copilot Studio
- D. an agent flow in Copilot Studio

Answer

Correct Answer: A

Your scenario describes:

- A Copilot Studio agent automating tasks in a web app
- Automation failing because the UI changes frequently
- You want a solution that minimizes changes to the agent

This is exactly the problem Computer Use is designed to solve.

Discussion: [h https://www.examttopics.com/discussions/microsoft/view/406241-exam-ab-100-topic-2-question-19-discussion/](https://www.examttopics.com/discussions/microsoft/view/406241-exam-ab-100-topic-2-question-19-discussion/)

047 Question.

A company processes invoices stored across multiple systems in multiple formats.

You need to implement an AI solution to automate the invoice processing. The solution must meet the following requirements:

- Automate multi-step invoice processing tasks, including document analysis, data validation, and approval routing.
- Enable users to interact directly via Microsoft Teams to review and approve invoices.
- Minimize development efforts to define and customize approval workflows.

What should you include in the solution?

- A. Azure Document Intelligence in Foundry Tools and Azure Logic Apps
- B. a SharePoint agent
- C. Microsoft Copilot Studio and AI Builder
- D. Azure OpenAI and Azure Functions

Answer

Correct Answer: C

Explanation:

Microsoft Copilot Studio and AI Builder AI Builder provides prebuilt and customizable document processing models (Invoice Processing, Form Processing) that can extract structured data from invoices across formats and systems. Copilot Studio can orchestrate multi-step workflows using:

- Agent flows
- Power Automate integration
- Reasoning steps
- Conditional logic

This gives you intelligent automation with minimal custom code.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406242-exam-ab-100-topic-2-question-20-discussion/>

048 Question.

You need to design a Microsoft Copilot Studio agent for customer support.

The agent must securely retrieve product warranty data from a REST API. The solution must minimize development effort.

What should you include in the design?

- A. Export the agent as a managed solution and customize the agent in Power Apps.
- B. Create a custom connector in Copilot Studio and use the connector to call the API.
- C. Use a Microsoft Power Automate desktop flow to screen scrape the warranty data.
- D. Add the warranty data to the Fallback topic.

Answer

Correct Answer: B

Explanation:

Create a custom connector in Copilot Studio To securely retrieve product warranty data from a REST API, the agent needs:

- A secure authentication mechanism
- A reusable, governed integration component
- Low-code configuration
- ALM-friendly deployment

A custom connector provides exactly that.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406243-exam-ab-100-topic-2-question-21-discussion/>

049 Question.

A company has an ecommerce support portal that uses Microsoft Dataverse.

You are designing a Microsoft Copilot Studio agent for the portal. The agent must meet the following requirements:

- Respond with a default help message when the user input is unclear.
- Initiate external processes, such as retrieving the order status, when users make specific requests.

Generative orchestration will be enabled for the solution.

You need to recommend a feature for each requirement.

What should you recommend? To answer, drag the appropriate features to the correct requirements. Each feature may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Features		Answer Area
A tool (connector)		Respond with a default help message when the user input is unclear:
A trigger phrase		
The Fallback topic		Initiate external processes when requested:
A skill		
The Escalate topic		

Answer

Correct Answer:

Explanation:

1. Fallback topic → Default help message

When user input is unclear, incomplete, or outside the agent's scope, the Fallback topic is the built-in mechanism that:

- Detects unrecognized intents
- Responds with a default help or clarification message
- Redirects the user back into a supported Flow

2. Tool (connector) → Initiate external processes

To retrieve order status or trigger any external system action, the agent must call a tool, which in Copilot Studio means:

- A connector (custom or standard)
- A Power Automate flow exposed as a tool

- Any external API wrapped as a tool

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406244-exam-ab-100-topic-2-question-22-discussion/>

050 Question.

A company uses Microsoft Dynamics 365 to manage service operations. Dispatchers coordinate service requests, and technicians perform scheduled on-site work.

You need to design a solution that will use Microsoft Copilot to improve the efficiency of the service operations. The solution must meet the following requirements:

- Provide AI-driven assistance to help staff organize and resolve work orders.
- Deliver contextual AI support to frontline workers as they prepare for and complete customer appointments.

Which two components should you include in the design? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Copilot Service workspace
- B. Copilot in Outlook
- C. Dynamics 365 Customer Service
- D. Copilot in Customer Service
- E. Copilot in Field Service
- F. the Dynamics 365 Field Service mobile app

Answer

Correct Answer:

Explanation:

E. Copilot in Field Service → This provides:

- AI-driven insights for work orders
- Assistance with scheduling, dispatching, and resolving service tasks
- Summaries, recommendations, and automated updates for service operatives

This directly supports dispatchers and back-office service staff.

F. Dynamics 365 Field Service mobile app → This gives frontline technicians:

- Contextual AI assistance during appointments
- Work order summaries

- Step-by-step guidance
- Real-time updates
- Integrated Copilot experiences in the mobile workflow

This is the only option that delivers AI support to technicians in the field.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406245-exam-ab-100-topic-2-question-23-discussion/>

051 Question.

A company uses Microsoft Foundry agents.

You need to ensure that an agent can dynamically use external tools at runtime without updating the agent.

What should you include in the solution?

- A. a Microsoft Foundry hub
- B. a Model Context Protocol (MCP) server
- C. Azure AI Search
- D. Microsoft Copilot Studio

Answer

Correct Answer: B

Explanation:

The right choice is B. a Model Context Protocol (MCP) server.

You need the agent to:

- Dynamically use external tools at runtime
- Without updating or redeploying the agent

That is exactly what Model Context Protocol (MCP) is designed for.

MCP allows a Foundry agent to:

- Discover tools dynamically
- Load new tools without modifying the agent
- Call external capabilities exposed by MCP servers

- Extend functionality at runtime This is the only mechanism in Foundry that supports dynamic tool availability.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406246-exam-ab-100-topic-2-question-24-discussion/>

052 Question.

You are designing an AI business solution that contains the following components:

- A Microsoft Power Automate workflow
- A Microsoft Copilot Studio agent
- A Microsoft Dataverse database
- A Microsoft Power Apps app

As part of the application lifecycle management (ALM) process, you plan to package the components, so that they can be deployed to other environments as a group.

You need to recommend a solution that supports versioning, dependencies, and deployments. What should you include in the recommendation?

- A. GitHub Actions
- B. Azure DevOps
- C. Microsoft Power Platform solutions

Answer

Correct Answer: C

Why GitHub Actions and Azure DevOps are not the primary answer Both GitHub Actions and Azure DevOps can automate ALM pipelines, but they rely on solutions as the underlying deployment artifact.

- They orchestrate CI/CD.
- They do not provide versioning, dependency management, or packaging by themselves.
- They require solutions to function in Power Platform ALM.

So they are optional enhancements—not the core ALM mechanism.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384405-exam-ab-100-topic-3-question-5-discussion/>

053 Question.

A company has Microsoft 365 Copilot agents.

You need to design a security solution for the agents. The solution must meet the following requirements:

- Identify and mitigate potential risks that relate to AI use.
- Protect AI apps and the sensitive data processed or generated by the agents.

- Support responsible AI governance by retaining and logging interactions, detecting policy violations, and investigating incidents.

Which two components should you include in the design? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Microsoft Purview
- B. Azure AI Content Safety
- C. role-based access control (RBAC) in Microsoft Foundry
- D. Microsoft Defender

Answer

Correct Answer: A,B

Explanation:

Correct answers: A. Microsoft Purview and B. Azure AI Content Safety

These are the only two components that together satisfy all three requirements:

risk identification, sensitive-data protection, and responsible AI governance for Microsoft 365 Copilot agents.

Purview provides the governance, auditing, and data-protection controls that Copilot agents rely on. Purview is the only Microsoft product that logs Copilot interactions and enforces data-protection policies across the Microsoft 365 ecosystem. Azure AI Content Safety provides AI-specific risk detection. This directly satisfies the requirement to identify and mitigate AI-related risks.

Discussion: <https://www.examtips.com/discussions/microsoft/view/384406-exam-ab-100-topic-3-question-6-discussion/>

054 Question.

You are creating validation criteria for a custom generative AI model that produces business reports based on internal enterprise data.

You need to assess whether the model's outputs are appropriate and meaningful for the business reports.

Which metric should you use?

- A. the number of active users interacting with the model
- B. alignment of the output to domain-specific tasks
- C. the average system resource usage during inference
- D. the model training duration

Answer

Correct Answer: B

Explanation:

The metric that determines whether a custom generative AI model produces appropriate and meaningful business reports is how well the model's output aligns with the specific business tasks and domain requirements.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384407-exam-ab-100-topic-3-question-7-discussion/>

055 Question.

A company has Microsoft Foundry agents that generate responses by using Azure OpenAI resources. The agents are deployed to both the United States and Europe.

A company mandate states that the agents and their grounding data must adhere to data residency and movement regulations.

You need to recommend a governance solution for the agents.

What should you include in the recommendation?

- A. Microsoft Defender for Cloud
- B. Azure Policy
- C. Azure Monitor
- D. Microsoft Purview

Answer

Correct Answer: D

Explanation:

For Microsoft Foundry agents and Azure OpenAI resources deployed across multiple regions (U.S. and Europe), the company must enforce data residency, data movement controls, governance, and auditing. Only Microsoft Purview provides the governance capabilities required for this scenario.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384408-exam-ab-100-topic-3-question-8-discussion/>

056 Question.

A company has a Microsoft Copilot Studio agent that uses custom connectors to interact with enterprise APIs.

You need to recommend an application lifecycle management (ALM) process to ensure that the connectors are deployed consistently across development, test, and production environments and

meet governance and traceability requirements.
What should you recommend?

- A. Deploy the APIs as Azure Functions.
- B. Manage the connectors as solution components and deploy the components by using ALM pipelines.
- C. Maintain connector definitions in environment variables.
- D. Export and import the connectors between the environments as unmanaged solutions.

Answer

Correct Answer: B

Explanation:

For **Copilot Studio / Power Platform ALM**, the recommended best practice is:

Use Solutions + ALM pipelines

- Custom connectors are **solution-aware components**
- They should be:
 - Stored inside **managed solutions**
 - Version-controlled
 - Deployed using **ALM pipelines (Power Platform Pipelines or Azure DevOps)**

This ensures:

- **Consistency** across Dev / Test / Prod
- **Governance** (controlled promotion of changes)
- **Traceability** (who changed what, when)
- **Repeatability** (automated deployments)

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384057-exam-ab-100-topic-3-question-9-discussion/>

057 Question.

A company plans to implement an AI solution that will contain a Microsoft Copilot Studio agent and a Microsoft Foundry agent. The solution will be stored in a source code repository. You need to recommend a deployment method for each agent. The solution must meet the following requirements:

- A test environment must be used before a deployment to production.
- Production must be isolated from development and testing.
- The deployment must be repeatable and fully automated.

- The solution must NOT require manual intervention.

Which deployment method should you recommend for each agent? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Copilot Studio:

Export from the source code repository and import to the target environment.

Use a Bicep file.

Use a Microsoft Power Platform deployment pipeline.

Microsoft Foundry:

Use a Bicep file.

Use a Microsoft Power Platform deployment pipeline.

Use an Azure DevOps pipeline.

Answer

Correct Answer:

Answer Area

Copilot Studio:

Export from the source code repository and import to the target environment.

Use a Bicep file.

Use a Microsoft Power Platform deployment pipeline.

Microsoft Foundry:

Use a Bicep file.

Use a Microsoft Power Platform deployment pipeline.

Use an Azure DevOps pipeline.

Explanation:

1) Copilot Studio agent → Use a Microsoft Power Platform deployment pipeline:

Power Platform deployment pipelines are the official ALM mechanism for Copilot Studio agents. They support:

- Dev → Test → Prod stages - Managed solution deployment
- Automated, repeatable deployments
- Isolation between environments
- No manual steps once configured

2) Microsoft Foundry agent → Use an Azure DevOps pipeline

Microsoft Foundry agents are deployed like Azure resources. To automate deployments from a source code repository with:

- Infrastructure-as-code
- CI/CD
- Multi-environment promotion
- No manual intervention

the correct choice is Azure DevOps pipelines (or GitHub Actions, but that option is not available in the answer list).

Discussion: <https://www.examtactics.com/discussions/microsoft/view/384071-exam-ab-100-topic-3-question-10-discussion/>

058 Question.

A company has a Microsoft Copilot Studio prompt-and-response agent.

You need to ensure that the agent meets the following requirements:

Provides effective and relevant responses

Provides conversational outcomes

Which metric should you use for each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Provides effective and relevant responses:

Generated answer rate and quality
Reactions
Tool use

Provides conversational outcomes:

Satisfaction
Tool use
Topics by outcome

Answer

Correct Answer:

Answer Area

Provides effective and relevant responses:

Generated answer rate and quality

Reactions

Tool use

Provides conversational outcomes:

Satisfaction

Tool use

Topics by outcome

Explanation:

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384058-exam-ab-100-topic-3-question-11-discussion/>

059 Question.

A company extends Copilot in Microsoft Dynamics 365 Customer Service.

You need to recommend an automated application lifecycle management (ALM) process so that the Copilot components can be safely developed, tested, and promoted to production.

Which two actions should you include in the ALM process? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Use an unmanaged solution in production.
- B. Rebuild the agents in each environment.
- C. Use Microsoft Power Platform pipelines.
- D. Include the components in a solution.
- E. Store the agent transcripts in source control.

Answer

Correct Answer:

Explanation: C, D

D. Include the components in a solution All Copilot extensions for Dynamics 365 Customer Service—custom actions, plugins, connectors, prompts, and Copilot Studio agents—must be packaged inside a Power Platform solution to support:

- Versioning
- Dependency tracking
- Environment isolation

- Managed deployments to Test/Prod

C. Use Microsoft Power Platform pipelines Deployment pipelines provide:

- Automated Dev → Test → Prod promotion
- No manual intervention
- Governance and approvals
- Repeatable deployments
- Managed solution enforcement in production

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384484-exam-ab-100-topic-3-question-12-discussion/>

060 Question.

You are designing a testing solution for a Microsoft Copilot Studio agent that integrates with Microsoft Dynamics 365 Customer Service and Dynamics 365 Sales.

You need to design end-to-end scenarios to test the agent's ability to perform the following actions:

Coordinate tasks and data interactions across both Dynamics 365 apps.

Interpret user input and provide contextually relevant outputs.

Which test scenario and metric should you include in the design? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Test scenario:	In each app, test isolated tasks without using workflows. Run task-based scenarios that involve both apps. Test visual consistency across both apps.
Metric:	Measure the initial prompt response time for each app. Track the average click rate across both apps. Track the successful completion of cross-app tasks.

Answer

Correct Answer:

Answer Area

Test scenario:

- In each app, test isolated tasks without using workflows.
- Run task-based scenarios that involve both apps.**
- Test visual consistency across both apps.

Metric:

- Measure the initial prompt response time for each app.
- Track the average click rate across both apps.
- Track the successful completion of cross-app tasks.**

Explanation:

- 1) **Test scenario: Run task-based scenarios that involve both apps** You must simulate end-to-end workflows that span Customer Service and Sales—such as creating a case, updating an opportunity, or retrieving customer history across systems.

This is exactly what task-based scenarios involving both apps are designed for.

- 2) **Metric: Track the successful completion of cross-app tasks** The best metric is whether the agent can successfully complete the multi-app tasks it was asked to perform. This validates:
- Correct interpretation of user intent
 - Correct grounding
 - Correct orchestration across systems
 - Correct data retrieval and updates

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384485-exam-ab-100-topic-3-question-13-discussion/>

061 Question.

A company has multiple AI models that support generation of sales transactions.

Each release of the models must be reviewed by a security and compliance team before being deployed to the production environment. The security and compliance team must have access to prior versions to properly determine potential exposures introduced.

You need to recommend a solution to evaluate the impact of each deployment to production. The solution must enhance business continuity.

What should you recommend?

- A. Create a central model registry that uses version history.
- B. Establish a promotion process by using a quality gate.

- C. Implement version control for all the AI system components.
- D. Track model retirement schedules to prevent service disruptions.

Answer

Correct Answer: A

Explanation:

A. Create a central model registry that uses version history. You described three key requirements: - Every model release must be reviewed by security and compliance before production. - Security must have access to prior versions to compare changes and detect new risks. - Business continuity must be protected — meaning controlled, traceable, reversible deployments. This is exactly the problem that a central model registry with versioning is designed to solve.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384059-exam-ab-100-topic-3-question-14-discussion/>

062 Question.

DRAG DROP -

A company has an AI solution that uses a Microsoft Copilot Studio agent.

You need to monitor the agent's performance. The solution must meet the following requirements:

Monitor the agent's telemetry in near-real-time (NRT).

Download transcripts of full conversations.

Monitor the agent's usage and performance.

What should you use for each requirement? To answer, drag the appropriate options to the correct requirements. Each option may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Options

Application Insights

Copilot Studio

Log Analytics

Microsoft Power Apps

Answer Area

Option

Monitor the agent's telemetry in NRT:

Download transcripts of full conversations:

Monitor the agent's usage and performance:

Answer

Correct Answer:

Options	Answer Area	Option
	Monitor the agent's telemetry in NRT:	Application Insights
	Download transcripts of full conversations:	Copilot Studio
Log Analytics	Monitor the agent's usage and performance:	Copilot Studio
Microsoft Power Apps		

Explanation:

Near-real-time telemetry → Application Insights Application Insights is the only option that provides live metrics, NRT telemetry, and deep diagnostics (requests, dependencies, exceptions, traces). Copilot Studio can surface analytics, but not true NRT telemetry.

Full conversation transcripts → Copilot Studio Copilot Studio includes the Transcripts area where you can export full conversations. Application Insights only stores event-level telemetry, not full transcripts.

Usage & performance monitoring → Copilot Studio Copilot Studio provides built-in analytics dashboards for:

- Session counts
- Escalations
- Resolution rates
- Channel usage
- CSAT
- Topic performance These are the standard usage/performance KPIs for Copilot Studio agents.

Discussion: <https://www.examtips.com/discussions/microsoft/view/384060-exam-ab-100-topic-3-question-15-discussion/>

063 Question.

A company deploys a Microsoft Copilot Studio agent that integrates with a Microsoft Power Automate desktop flow.

You need to recommend a testing solution that meets the following requirements:

Test cases must validate the most recent changes to the agent before the agent is released.

The flow must be validated as part of the agent's orchestration.

What should you recommend for each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Validate the most recent changes to the agent before release:

- Publish the agent to a channel and test the agent on live users.
- Run tests against the latest unpublished version of the agent.
- Run tests against the production version of the agent.

Validate the flow as part of the agent's orchestration:

- Add the flow to the agent as a tool.
- Add the flow to a canvas app.
- Use the Power Automate for desktop console.

Answer

Correct Answer:

Answer Area

Validate the most recent changes to the agent before release:

- Publish the agent to a channel and test the agent on live users.
- Run tests against the latest unpublished version of the agent.
- Run tests against the production version of the agent.

Validate the flow as part of the agent's orchestration:

- Add the flow to the agent as a tool.
- Add the flow to a canvas app.
- Use the Power Automate for desktop console.

Explanation:

The correct pair is:

- Validate the most recent changes to the agent before release: **Run tests against the latest unpublished version of the agent.** This is the only option that ensures you are validating new changes before publishing. Testing on production or live users would not meet the requirement.
- Validate the flow as part of the agent's orchestration: **Add the flow to the agent as a tool.** A Power Automate desktop flow must be exposed to Copilot Studio as a tool so the agent can call it during orchestration. Canvas apps and the PAD console do not integrate with Copilot Studio orchestration.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384061-exam-ab-100-topic-3-question-16-discussion/>

064 Question.

A company has a Microsoft Copilot Studio agent that provides answers based on a knowledge base for customer support.

Users report that, occasionally, the agent provides inaccurate answers.

You need to use metrics from the Analytics tab in Copilot Studio to identify the cause of the inaccuracies.

Which two options should you use? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. survey results
- B. session information and session outcomes
- C. topic usage and topics with low resolution
- D. engagement, resolution, and escalation rates
- E. quality of generated answers

Answer

Correct Answer: B, C

Explanation:

B. Session information and session outcomes

- These metrics show:
- How conversations flow
- Where users get stuck
- Whether sessions end in success, abandonment, or escalation
- They help you pinpoint *where* the bot misunderstood the user or failed to resolve an issue.

C. Topic usage and topics with low resolution

- These metrics reveal:
- Which topics are triggered most often
- Which topics fail to resolve successfully
- Where the bot may be matching the wrong topic or lacking knowledge

Low-resolution topics are a strong indicator of inaccurate or incomplete answers.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384062-exam-ab-100-topic-3-question-17-discussion/>

065 Question.

A company uses a fine-tuned Microsoft Foundry model that requires frequent updates as new customer feedback becomes available.

You need to design an application lifecycle management (ALM) process that meets the following requirements:

Data changes must be tracked and versioned.

The model must be retrained consistently by using approved training data.

Which two actions should you include in the design? Each correct answer presents part of the

solution.

NOTE: Each correct selection is worth one point.

- A. Associate the storage location to the fine-tuning job.
- B. Create a content filter.
- C. Store the training data in Azure Files.
- D. Upload the training data to Microsoft Foundry data files
- E. Store the training data in Azure Blob Storage that has version control enabled.

Answer

Correct Answer:

Explanation:

A. Associate the storage location to the fine-tuning job Foundry fine-tuning jobs support referencing a storage location (Blob Storage or Foundry data files). This ensures:

- The model is always trained on the approved dataset
- Retraining is consistent and repeatable
- The job pulls data from a controlled, governed location

This is essential for ALM.

E. Store the training data in Azure Blob Storage with version control Blob Storage with versioning provides:

- Automatic version history of every dataset change
- Ability to roll back to prior versions
- Full traceability for compliance and audits
- A single source of truth for training data

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384486-exam-ab-100-topic-3-question-18-discussion/>

066 Question.

A company deploys agents that generate responses by using Azure OpenAI resources. The agents are deployed to both the United States and Europe.

You need to recommend a governance solution that meets the following requirements:

Enforces the deployment of the resources to only approved Azure regions

Provides continuous compliance verification of the resources

What should you include in the recommendation for each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point..

Answer Area

Enforces the deployment of the resources to only approved regions:

Azure Monitor
Azure Policy
Microsoft Defender for Cloud
Microsoft Purview
Microsoft Sentinel

Provides continuous compliance verification of the resources:

Azure Monitor
Azure Policy
Microsoft Defender for Cloud
Microsoft Purview
Microsoft Sentinel

Answer

Correct Answer:

Answer Area

Enforces the deployment of the resources to only approved regions:

Azure Monitor
Azure Policy
Microsoft Defender for Cloud
Microsoft Purview
Microsoft Sentinel

Provides continuous compliance verification of the resources:

Azure Monitor
Azure Policy
Microsoft Defender for Cloud
Microsoft Purview
Microsoft Sentinel

Explanation:

1. **Azure Policy** → Restrict deployments to approved regions Azure Policy can enforce rules such as: - “Resources may only be deployed in East US and West Europe” - “Deny creation of resources outside approved regions” This is the only tool designed for preventive governance.
2. **Microsoft Defender for Cloud** → Continuous compliance verification Defender for Cloud provides: - Continuous compliance assessments - Regulatory standards

mapping (ISO, SOC, GDPR, etc.) - Secure score - Alerts when resources drift out of compliance This satisfies the requirement for ongoing compliance monitoring.

.Discussion: <https://www.examtopycs.com/discussions/microsoft/view/384063-exam-ab-100-topic-3-question-19-discussion/>

067 Question.

A company has an AI solution that uses Azure OpenAI models.
You need to recommend a governance solution that monitors and audits changes to model configurations and data usage. The solution must minimize administrative effort.
What should you include in the recommendation?

- A. Azure Monitor
- B. Azure Stream Analytics
- C. Azure API Management
- D. Azure Policy
- E. Microsoft Purview

Answer

Correct Answer: E

Explanation:

The requirement is clear: You need governance over model configuration changes and data usage, with minimal administrative effort. Among the options, only one service is designed specifically for:

- Monitoring data access and usage
- Auditing model-related assets
- Tracking sensitive data flows
- Providing governance with minimal overhead

That service is Microsoft Purview.

Discussion: <https://www.examtopycs.com/discussions/microsoft/view/384064-exam-ab-100-topic-3-question-20-discussion/>

068 Question.

A company uses Azure OpenAI models that use grounding data from Microsoft Fabric for agents. The models are fine-tuned by using proprietary datasets.
You need to design a governance solution that meets the following requirements:
Restricts access to the grounding data to only assigned roles
Restricts model fine-tuning to only the AI engineering team
What should you include in the design? To answer, select the appropriate options in the answer

area.

NOTE: Each correct selection is worth one point.

Answer Area

Restricts access to the grounding data:

Azure AI Content Safety
Azure Monitor alerts
Azure Policy compliance rules
Microsoft Purview access policies

Restricts model fine-tuning:

Azure Policy compliance rules
Azure Resource Manager (ARM) resource locks
Microsoft Entra Conditional Access
Role-based access control (RBAC) in Microsoft Foundry

Answer

Correct Answer:

Answer Area

Restricts access to the grounding data:

Azure AI Content Safety
Azure Monitor alerts
Azure Policy compliance rules
Microsoft Purview access policies

Restricts model fine-tuning:

Azure Policy compliance rules
Azure Resource Manager (ARM) resource locks
Microsoft Entra Conditional Access
Role-based access control (RBAC) in Microsoft Foundry

Explanation:

1. Microsoft Purview access policies → Restrict access to grounding data Grounding data stored in Microsoft Fabric can be governed using:

- Purview access policies
- Data-level permissions
- Role-based access to sensitive datasets

Purview is the only option that provides fine-grained, centralized data access governance.

2. RBAC in Microsoft Foundry → Restrict model fine-tuning Fine-tuning operations in Foundry are controlled through:

- Foundry workspace roles
- Model-level permissions
- Restricting fine-tuning to specific security groups (e.g., AI engineering team)

This ensures only authorized users can initiate fine-tuning jobs.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384487-exam-ab-100-topic-3-question-21-discussion/>

069 Question.

A company has a Microsoft Copilot Studio agent that has been in production for three months. The agent has received positive feedback from users.

You need to identify the number of questions unanswered by the agent and the number of abandoned sessions between the users and the agent.

Which Copilot Studio insights should you use? To answer, drag the appropriate insights to the correct requirements. Each insight may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Insights	Answer Area	Insight
Conversation outcomes	The number of unanswered questions:	
Generated answer rate and quality	The number of abandoned sessions:	
Reactions		
Survey results		

Answer

Correct Answer:

Insights	Answer Area	Insight
	The number of unanswered questions:	Generated answer rate and quality
	The number of abandoned sessions:	Conversation outcomes
Reactions		
Survey results		

Explanation:

1. Generated answer rate and quality → Unanswered questions This insight shows:

- How often the agent generated an answer

- How many times it failed to answer
- Quality and grounding issues

It is the only insight that directly exposes unanswered or low-quality responses.

2. Conversation outcomes → Abandoned sessions Conversation outcomes include:

- Completed sessions
- Escalated sessions
- Failed sessions
- Abandoned sessions

This is the metric used to track when users leave before the agent completes the task.

Discussion: <https://www.examtips.com/discussions/microsoft/view/384488-exam-ab-100-topic-3-question-22-discussion/>

070 Question.

You are evaluating a Microsoft Copilot Studio agent that supports Microsoft Dynamics 365 Customer Service representatives.

You need to recommend a testing solution that meets the following requirements:

Evaluates agent effectiveness during active sessions

Validates whether the agent delivers accurate and helpful responses

Provides measurable, actionable insights for continuous improvement

What should you recommend?

- A. Track resolution, deflection, and accuracy by using dashboards and use scripts to ensure consistent responses.
- B. Perform load testing to validate how the agent scales under a high chat volume.
- C. Review historical tickets to find agents that have the shortest resolution times.
- D. Measure uptime and page load times.

Answer

Correct Answer: A

Explanation:

The correct recommendation is: A. Track resolution, deflection, and accuracy by using dashboards and use scripts to ensure consistent responses. Resolution, deflection, and accuracy dashboards provide:

- Real-time effectiveness metrics
- How often the agent resolves vs. escalates
- How many cases are deflected
- Accuracy and grounding quality
- Patterns of failure or misunderstanding

Using scripts ensures consistent prompts and scenarios so you can measure improvements over time.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384489-exam-ab-100-topic-3-question-23-discussion/>

071 Question.

A company uses multiple Microsoft Copilot Studio agents across different channels. You need to recommend a monitoring solution that provides comprehensive telemetry data and performance insights for the agents.

What should you include in the recommendation?

- A. Application Insights
- B. Azure Advisor
- C. Azure DevOps
- D. Microsoft Dynamics 365 Customer Voice

Answer

Correct Answer:

Explanation:

The correct recommendation is: A. Application Insights

When a company uses multiple Copilot Studio agents across different channels, you need a monitoring solution that can:

- Collect centralized telemetry
- Track performance, latency, failures, and usage patterns
- Provide end-to-end observability
- Support custom events, traces, and distributed logging
- Scale across all agents and channels

Application Insights is the only option that delivers this level of comprehensive monitoring.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/384490-exam-ab-100-topic-3-question-24-discussion/>

072 Question.

A company has an AI solution built by using Microsoft Copilot Studio and Power Platform. The solution is used by the company's sales, marketing, and customer service teams. You are performing a return on AI investment (ROAI) analysis to evaluate the impact of the solution. You need to identify which measurable business drivers to include in the analysis.

Which two business drivers should you identify? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. the reduced average case resolution time
- B. market capitalization
- C. economic market predictability
- D. increased employee productivity
- E. brand awareness

Answer

Correct Answer: A,D

Explanation:

A. the reduced average case resolution time

This is a classic ROAI metric because it directly measures:

- Faster customer service handling
- Reduced operational cost per case
- Higher customer satisfaction
- Improved throughput for support teams

It's quantifiable, trackable, and directly impacted by AI assistance.

D. increased employee productivity

AI copilots improve productivity by:

- Automating repetitive tasks
- Drafting responses
- Summarizing customer interactions
- Reducing manual data entry

This leads to measurable gains such as:

- More cases handled per agent
- More leads processed
- More time spent on high-value tasks

Discussion: <https://www.examtips.com/discussions/microsoft/view/384093-exam-ab-100-topic-3-question-25-discussion/>

073 Question.

A company has a Microsoft Foundry agent that summarizes customer feedback and recommends products to customers. The agent references data from multiple knowledge sources.

Users report that the agent response time is slow.

Telemetry data shows that the agent frequently reaches its token usage limit.

You need to recommend a solution to reduce token usage without degrading the quality of the generated responses.

What should you recommend?

- A. Chunk documents during indexing.
- B. Reduce the number of knowledge sources used by the agent.
- C. Reconfigure the prompts to limit the amount of retrieved content from the knowledge sources.
- D. Lower the maximum token usage limit for the responses.

Answer

Correct Answer: C

Explanation:

This reduces token usage by:

- Restricting how much grounding data is pulled into the prompt
- Summarizing or chunking retrieved content before passing it to the model
- Using more selective retrieval instructions
- Reducing unnecessary context while keeping quality intact

This is the standard optimization technique for Foundry and Azure OpenAI agents that hit token ceilings.

It improves latency and reduces cost without degrading answer quality.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406252-exam-ab-100-topic-3-question-26-discussion/>

074 Question.

A company has Microsoft Power Platform development, staging, and production environments. Each environment has its own Microsoft Dataverse tables and Azure AI Search index.

You are designing an application lifecycle management (AIM) process to deploy a Microsoft Copilot Studio agent between the environments.

The company has a Copilot Studio agent named Agent1 in development. Agent1 uses the following grounding data sources:

- A Dataverse table named CustomerOrders
- An Azure AI Search index named customer-knowledge

You need to deploy Agent1 to production. The solution must ensure that the agent uses the production grounding data sources, minimizes downtime, and handles credentials and endpoints securely.

What should you include in the deployment package solution, and what should you reconfigure after the deployment? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Include in the deployment package solution:

- Agent1 only
- The data sources only
- Agent1 and the data source connections
- Agent1 and references to the data sources
- Agent1, the data sources, and the data source connections

Reconfigure after the deployment:

- The Dataverse connection only
- The Azure AI Search connection only
- The Dataverse and Azure AI Search connections
- The Agent1 configuration
- The environment variables

Answer

Correct Answer:

Answer Area

Include in the deployment package solution:

- Agent1 only
- The data sources only
- Agent1 and the data source connections
- Agent1 and references to the data sources
- Agent1, the data sources, and the data source connections

Reconfigure after the deployment:

- The Dataverse connection only
- The Azure AI Search connection only
- The Dataverse and Azure AI Search connections
- The Agent1 configuration
- The environment variables

Explanation:

1. Agent1 and references to the data sources

You do not include actual data sources (Dataverse tables or Azure AI Search indexes) in the solution package. Each environment already has its own:

- Dataverse table: CustomerOrders
- Azure AI Search index: customer-knowledge

Instead, you include:

- Agent1 - References to the data sources (not the data sources themselves)

2. The Dataverse and Azure AI Search connections

Connections contain:

- Environment-specific endpoints
- Environment-specific credentials
- Environment-specific indexes/tables

Therefore, after deployment you must reconfigure:

- Dataverse connection → point to production CustomerOrders
- Azure AI Search connection → point to production customer-knowledge index

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406253-exam-ab-100-topic-3-question-27-discussion/>

075 Question.

A company has a Microsoft Copilot Studio agent that uses generative AI to assist Microsoft Dynamics 365 Customer Service representatives.

The agent currently exhibits a low resolution rate and a high escalation rate.

You need to identify the issue.

What should you use?

- A. the Agent dashboard of Dynamics 365 Customer Service historical analytics
- B. the Insights tab from the Search & intelligence settings of the Microsoft 365 admin center
- C. the Copilot hub in the Power Platform admin center
- D. the Analytics tab in Copilot Studio

Answer

Correct Answer: D

Explanation:

The Analytics tab in Copilot Studio provides:

- Resolution rate
- Escalation rate
- Abandoned sessions
- Unanswered questions
- Topic performance
- Generated answer quality
- Grounding effectiveness
- Session outcomes

Discussion: <https://www.examtopycs.com/discussions/microsoft/view/406254-exam-ab-100-topic-3-question-28-discussion/>

076 Question.

A company has a Microsoft Foundry generative AI model.

You need to evaluate the model's output to measure the overall quality and coherence of generated responses. The evaluation must use GPT-4o as a judge and return a numeric score for each output.

Which type of metric should you use?

- A. AI quality (NLP)
- B. risk and safety
- C. Groundedness
- D. AI quality (AI assisted)

Answer

Correct Answer: D

Explanation:

AI quality (AI assisted) This metric:

- Uses an LLM (like GPT-4o) as an evaluator
- Scores each output numerically
- Measures coherence, clarity, helpfulness, and correctness
- Provides consistent, automated evaluation
- Is the recommended approach for Foundry model quality assessment

This is exactly what the question describes.

Discussion: <https://www.examtopycs.com/discussions/microsoft/view/406255-exam-ab-100-topic-3-question-29-discussion/>

077 Question.

You use Microsoft Copilot Studio analytics to analyze the performance of a deployed Copilot Studio agent.

You need to identify which performance metrics to use to measure the following:

- The percentage of engaged sessions that are escalated to a live customer service representative
- The number of agent queries that cause a knowledge source error

What should you identify for each requirement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

The percentage of engaged sessions that are escalated to a representative:

Answer quality
Customer Satisfaction (CSAT) score
Engagement rate
Escalation rate

The number of agent queries that cause a knowledge source error:

Answer quality
Engagement rate
Escalation rate

Answer

Correct Answer:

Answer Area

The percentage of engaged sessions that are escalated to a representative:

Answer quality
Customer Satisfaction (CSAT) score
Engagement rate
Escalation rate

The number of agent queries that cause a knowledge source error:

Answer quality
Engagement rate
Escalation rate

Explanation:

1. Escalation rate → % of engaged sessions escalated Escalation rate measures:

- How many engaged sessions required a human handoff
- The percentage of conversations that the agent could not resolve
- A key indicator of agent effectiveness This directly matches the first requirement.

2. Answer quality → Knowledge source errors The Answer quality insight includes:

- Knowledge source errors
- Retrieval failures - Hallucinations
- Poor grounding
- Low-quality or incomplete answers

It is the only metric that reports knowledge source errors.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406256-exam-ab-100-topic-3-question-30-discussion/>

078 Question.

A company plans to deploy a Microsoft Foundry agent.

You need to recommend an application lifecycle management (ALM) process to ensure that the agent evaluates against baseline accuracy metrics before being deployed.

What should you recommend?

- A. Configure GitHub Actions for new agent versions.
- B. Deploy each new agent version directly to production.
- C. Use Observability in Foundry Control Plane with evaluation and drift monitoring.
- D. Enable Application Insights and use Azure Monitor.

Answer

Correct Answer: C

Explanation:

Observability in Foundry Control Plane gives you:

- Automated evaluation pipelines
- Baseline accuracy scoring
- LLM-as-a-judge evaluations
- Drift detection (data drift, behavior drift, quality drift)
- Quality gates before deployment

- Continuous monitoring after deployment

This is exactly what an ALM process requires for safe, high-quality AI deployment.

Discussion: <https://www.examtactics.com/discussions/microsoft/view/406257-exam-ab-100-topic-3-question-31-discussion/>

079 Question.

You need to recommend a security solution for agents in a Microsoft Power Platform environment.

The agents must use only approved connectors and services. The solution must prevent the agents from accessing sensitive data.

What should you recommend?

- A. Configure Azure Monitor to capture connector activity logs.
- B. Enable a Microsoft Dataverse audit.
- C. Deploy data loss prevention (DLP) policies in Power Platform.
- D. Enable customer-managed keys in Microsoft Dataverse.

Answer

Correct Answer: C

Explanation:

Deploy data loss prevention (DLP) policies in Power Platform Power Platform DLP policies allow you to:

- Control which connectors agents are allowed to use
- Block or restrict unapproved or risky connectors
- Separate connectors into Business, Non-Business, and Blocked categories
- Prevent agents from accessing sensitive data sources
- Apply policies at the environment, tenant, or solution level

This is the official and recommended way to enforce connector governance for Copilot Studio agents, Power Automate flows, and Power Apps.

Discussion: <https://www.examtactics.com/discussions/microsoft/view/406258-exam-ab-100-topic-3-question-32-discussion/>

080 Question.

A company has an AI business solution that uses Microsoft Copilot Studio agents.

You need to recommend prompt best practices to improve the effectiveness of agent interactions.

Which two actions should you include in the recommendation? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Track the duration of the average user session.
- B. Analyze the prompt length distribution.
- C. Regularly test and refine the prompts based on user input.
- D. Use clear and specific instructions in the prompts.
- E. Measure system resource usage during prompt processing.

Answer

Correct Answer: C,D

Explanation:

- **C. Regularly test and refine the prompts based on user input**

Clear prompts reduce ambiguity and help the agent:

- Stay on topic
- Produce more accurate responses
- Follow business rules consistently

This is one of the core principles of effective prompt engineering.

- **D. Use clear and specific instructions in the prompts**

Prompts must evolve based on:

- Real user interactions
- Failure cases
- Escalations
- Low-quality answers

Iterative refinement is essential for improving agent performance over time.

Discussion: <https://www.examtactics.com/discussions/microsoft/view/406259-exam-ab-100-topic-3-question-33-discussion/>

081 Question.

A company has a cloud-based AI solution that uses Azure OpenAI models.

You need to design a monitoring solution that meets the following requirements:

- Monitors performance metrics and operational health for the models
- Monitors AI apps and agents for compliance

- Uses Azure-native capabilities
- Minimizes development effort

What should you use for each requirement? To answer, drag the appropriate options to the correct requirements. Each option may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Options	Answer Area
Azure API Management	Monitors AI app and agents for compliance:
Azure Policy	Monitors performance metrics and operational health:
Microsoft Defender	
Azure Monitor	
Azure Stream Analytics	
Microsoft Purview	

Answer

Correct Answer:

Options	Answer Area
Azure API Management	Monitors AI app and agents for compliance: Microsoft Purview
Azure Policy	Monitors performance metrics and operational health: Azure Monitor
Microsoft Defender	
Azure Stream Analytics	

Explanation:

1. Microsoft Purview → Compliance

Monitoring Purview provides:

- Data access governance
- Sensitive data classification
- Lineage tracking
- Policy enforcement

- Compliance insights for AI apps and agents

It is the only Azure-native service designed specifically for compliance monitoring.

2. Azure Monitor → Performance & operational health

Azure Monitor provides:

- Latency metrics
- Throughput
- Token usage
- Errors and exceptions
- Dependency performance
- Health dashboards

It is the standard Azure-native solution for operational monitoring of Azure OpenAI and AI applications.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406260-exam-ab-100-topic-3-question-34-discussion/>

082 Question.

A company has Microsoft Copilot Studio agents.

The company plans to deploy custom connectors across development, test and production environments.

You need to design an application lifecycle management (ALM) process to ensure consistency and prevent direct editing in production.

Which two actions should you include in the design? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Deploy managed solutions to production.
- B. Deploy unmanaged solutions to production.
- C. Manually rebuild the agents in each environment.
- D. Move the agents between the environments by using data export and import.
- E. Include agents and connectors in a solution.

Answer

Correct Answer: A,E

Explanation:

A. Deploy managed solutions to production Managed solutions:

- Prevent editing in production (a key requirement)
- Lock down components so only dev/test can modify them
- Ensure controlled, versioned deployments
- Are the Microsoft-recommended practice for production environments

E. Include agents and connectors in a solution This is essential because:

- Solutions are the ALM unit in Power Platform
- Custom connectors must be packaged inside solutions for proper versioning
- Copilot Studio agents are solution components and must be moved this way
- Ensures consistent deployment across environments

Discussion: <https://www.examtopycs.com/discussions/microsoft/view/406261-exam-ab-100-topic-3-question-35-discussion/>

083 Question.

A company uses multiple Microsoft Copilot Studio agents across different channels.

You need to recommend a monitoring solution that provides comprehensive telemetry data and performance insights for the agents.

What should you include in the recommendation?

- A. Application Insights
- B. Microsoft Dynamics 365 Customer Voice
- C. Log Analytics
- D. Microsoft Purview

Answer

Correct Answer: A

Explanation:

Application Insights gives:

- End-to-end telemetry
- Latency, token usage, failures, exceptions
- Dependency tracking (Dataverse, connectors, APIs)
- Custom events for agent interactions
- Dashboards and alerts
- Works across all channels (web, Dynamics, custom apps)

This is the recommended monitoring solution for Copilot Studio agents at scale.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406262-exam-ab-100-topic-3-question-36-discussion/>

084 Question.

A company has an AI solution named Solution1 that is deployed to the production environment. Solution1 uses an Azure OpenAI model to generate marketing emails for existing customers.

During an internal review, you identify that Solution1 creates different emails depending on the customers' traits.

You need to recommend a strategy to mitigate the bias. The strategy must adhere to Microsoft responsible AI principles.

What should you recommend?

- A. Modify Solution1 to randomly generate emails for different traits.
- B. Modify the system instructions of Solution1.
- C. Retrain the model by using a larger dataset.
- D. Modify the contents of the training dataset.

Answer

Correct Answer: D

Explanation:

Bias in model outputs typically originates from:

- Biased or unbalanced training data
- Over-representation of certain traits
- Patterns in the dataset that the model learns and amplifies

Responsible AI guidance from Microsoft emphasizes:

- Reviewing and correcting training data
- Removing or balancing sensitive attributes
- Ensuring datasets do not encode harmful or discriminatory patterns

This is the most direct and effective way to mitigate bias.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/406263-exam-ab-100-topic-3-question-37-discussion/>

085 Question.

A company has a canvas app named App1 in a Microsoft Power Platform environment named Env1.

Env1 uses a customer-managed key for data encryption. App1 connects to multiple data sources to retrieve and update customer and order information.

You need to recommend a solution to add Microsoft Copilot components to App1. The solution must NOT modify the current security or encryption configurations of Env1.

What should you include in the recommendation?

- A. Modify the data sources of App1 to make them compatible with Copilot.
- B. Duplicate App1 and republish the app in Env1.
- C. Enable Copilot features for Env1.
- D. Move App1 to a new environment that uses Microsoft-managed keys.

Answer

Correct Answer: C

Explanation:

Copilot features in Power Apps (Copilot control, Copilot answers, Copilot suggestions) are environment-level capabilities. Enabling them:

- Does NOT modify encryption settings (CMK remains untouched)
- Does NOT require moving the app
- Does NOT require changing data sources
- Allows Copilot components to be added directly to App1

Microsoft explicitly supports Copilot features in environments using customer-managed keys.

Discussion: <https://www.examtopycs.com/discussions/microsoft/view/406264-exam-ab-100-topic-3-question-38-discussion/>
