

CASE 01 CONTOSO

Contoso Suites is an animal shelter that specializes in finding homes for dogs that have been given up by their owners. The shelter can house up to 20 dogs.

The shelter is implementing one model-driven Power Apps app to track the dogs and schedule meetings with potential adopters. No other apps will be created.

The model-driven app uses Dataverse with out-of-the-box functionality when possible. Dataverse is set up with the following configuration:

- The solution prefix “cs” is used for all new components.
- Only the root business unit is used.
- All tables are stored in Dataverse and do not require rapid scaling.
- Exchange server-side sync is not configured.

Adopters

- Adopter information is stored in a Contact table.
- Contacts are considered to be duplicates if they have the same email address and last name.
- Adopters are often late to meetings, so a reminder email is sent to them two hours before their meeting.
- The email reminders must not be tracked in the system.

Dogs

- Dog information is stored in a Dog table, which is organization owned.
- Breed, size, and weight are fields in the table..

Dog residency

- A Resident table tracks the stay of each dog.
- Each resident record has a lookup for the dog and its food.
- The food type and amount are logged on each resident record. Auto-posting is not configured for changes to food type and amount.
- A fee of \$120 is in a currency column named Adoption Fee. This fee can be changed depending on the adoption circumstances.
- A formula column named Deposit is automatically populated with 20% of the adoption fee.
- A resident record is generated automatically when a dog record is created. This is the only way a resident record can be created.

Exercise and feedings

- Exercise for the dogs is tracked in an Exercise table.
- Feedings are tracked in a Feeding table.

- Exercise and feeding records appear in a resident record timeline.

Care staff

- The care staff must be able to view who changed the food type and the amount that was given, for up to three months ago.
- The staff must be able to update the weight of a dog on the resident record.
- The staff report that the buttons are too small on the touch screen they use to log exercise and feeding.
- The staff must be able to view who the adopters are for upcoming meetings. The staff must not be able to update adopter information.

Administrative staff

- Administrative staff must receive a weekly list of duplicate contacts. Duplicate alerts must not appear when a staff member saves a new contact.
- When an adopter wants to adopt a dog, the staff must perform a series of adoption duties in order. The following duty list must be displayed on the screen:
 - Commitment:
 - Obtain adopter signature in a commitment document.
 - Collect deposit.
 - Pre-pickup:
 - Document spay or neutering date.
 - Perform spay or neutering.
 - Document pickup date.
 - Pickup:
 - Collect full payment.
 - Verify dog is picked up.
 - A dog must be picked up no sooner than two days after spaying or neutering.
 - A pop-up window must appear with an error message if the Pickup date is too soon.
 - Only administrative staff must be able to add new adopters and dogs.

Question 01 - 01

You need to set up the capability to view the change history for the food type and amount.

What should you set up? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Set up the capability to view change history

Feature to be configured

	▼
Activity view	
Timeline view	
Audit user access	
Audit changes to its data	

Table to be configured

	▼
Dog	
Feeding	
Resident	

Answer 01 - 01

Correct Answer:

Set up the capability to view change history

Feature to be configured

	▼
Activity view	
Timeline view	
Audit user access	
Audit changes to its data	

Table to be configured

	▼
Dog	
Feeding	
Resident	

Scenario:

You The requirement states:

"The care staff must be able to view who changed the food type and the amount that was given, for up to three months ago."

To track:

- Who made the change
- What value changed
- When the change occurred

you must enable **Auditing** on the table and the relevant columns.

The fields **Food Type** and **Amount** are stored on the **Resident** table:

"The food type and amount are logged on each resident record."

Therefore, auditing must be configured on the **Resident** table.

Reference: <https://www.examttopics.com/discussions/microsoft/view/156860-exam-pl-200-topic-1-question-72-discussion/>

Question 01 – 02

You need to configure the Deposit column.

How should you write the formula?

- A. `Decimal('Adoption Fee') * 0.20`
- B. `'Adoption Fee' * 0.20`
- C. `Decimal('Adoption Fee' * 20%)`
- D. `'Adoption Fee' * 20%`

Answer 01 - 02

Correct Answer: A

The scenario states:

- **Adoption Fee** is a **Currency** column.
- **Deposit** is a **Formula** column.
- Deposit must automatically contain **20% of the Adoption Fee**.

In Dataverse formula columns, you can directly reference a currency column and multiply it by a percentage:

- `'Adoption Fee' * 20%`

Reference: <https://www.examttopics.com/discussions/microsoft/view/156861-exam-pl-200-topic-1-question-73-discussion/>

Question 01 - 03

You need to set up a security role for the care staff.

Which privileges should you set? To answer, move the appropriate privileges to the correct create, read, write tables. You may use each create, read, write privileges once, more than once, or not at all. You may need to move the split bar between panes or scroll to view content.

Privileges

- None – Organization – None
- Organization – Organization - None
- None – Organization – Organization

Table with Create - Read - Write privileges

Tables	Create – Read - Write
Adopters	
Dogs	
Residents	

Answer 01 - 03

Correct Answer:

Privileges

-
- Organization – Organization - None
-

Table with Create - Read - Write privileges

Tables	Create – Read - Write
Adopters	None – Organization – None
Dogs	None – Organization – Organization
Residents	None – Organization – Organization

From the scenario:

- **Care staff must be able to view upcoming meeting adopters but must not update adopter information.**
- **Care staff must be able to update the weight of a dog on the resident record.**
- **Only administrative staff can add new adopters and dogs.**
- There is only the **root business unit**, so organization-level access is appropriate.

Why

- **Adopters:** Care staff only need to view adopter information for upcoming meetings; they must not create or modify adopters.
 - **None – Organization – None**

- **Dogs:** Care staff must update dog weight, but only administrative staff can create dogs.
 - **None – Organization – Organization**
- **Residents:** Care staff need to update resident-related information, but resident records are created automatically when a dog is created.
 - **None – Organization – Organization**

Reference: <https://www.examttopics.com/discussions/microsoft/view/157045-exam-pl-200-topic-1-question-74-discussion/>

Question 01 – 04

You need to define the table types for Contoso Suites.

Which table type should you define for each requirement? To answer, move the appropriate table types to the correct tables. You may use each table type once, more than once, or not at all. You may need to move the split bar between panes or scroll to view content.

Types

Activity

Elastic

Standard

Virtual

Table types for each table

Adopters

Dogs

Exercise

Feeding

Answer 01 - 04

Correct Answer:

Types	Table types for each table
	Adopters Standard
Elastic	Dogs Standard
	Exercise Activity
Virtual	Feeding Activity

Based on the scenario:

- **Adopters** are stored in the existing **Contact** table and do not require special scaling or external data → **Standard**.
- **Dogs** are stored in Dataverse, do not require rapid scaling, and are organization-owned → **Standard**.
- **Exercise** records appear in the Resident timeline. Timeline entries must use an **Activity table**.
- **Feeding** records also appear in the Resident timeline. Timeline entries must use an **Activity table**.

Reference: <https://www.examttopics.com/discussions/microsoft/view/157046-exam-pl-200-topic-1-question-75-discussion/>

Question 01 – 05

You need to improve the user experience for the care staff to log exercise and feeding.

What should you create?

- Custom page in a model-driven app
- Model-driven app form
- Power BI report
- Canvas app

Answer 01 - 05

Correct Answer: D

The requirement is:

"The staff report that the buttons are too small on the touch screen they use to log exercise and feeding."

Canvas apps are designed for **task-focused, touch-friendly user experiences** and allow complete control over:

- Button size
- Layout
- Screen design
- Mobile and tablet usability

This makes them ideal for care staff who need to quickly record exercise and feeding activities on a touch screen.

Why not the others?

- **A. Custom page in a model-driven app**
 - Can improve the experience, but the standard Microsoft recommendation for highly customized touch-friendly data-entry scenarios is a **canvas app**.
- **B. Model-driven app form**
 - Forms provide limited control over the UI and button sizing.
 - They would not adequately address the touch-screen usability issue.
- **C. Power BI report**
 - Used for analytics and reporting, not for entering exercise and feeding records.

Exam Tip

When a scenario mentions:

- Touch screens
- Mobile-friendly data entry
- Large buttons
- Highly customized user experience

The expected Power Platform answer is usually **Canvas App**.

Reference: <https://www.examttopics.com/discussions/microsoft/view/157034-exam-pl-200-topic-2-question-55-discussion/>

Question 01 – 06

You need to enable the care staff to update a dog's weight.

Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Actions

Add a code component.

Select the lookup.

Edit the dog form.

Edit the resident form.

Add a form component.

Form configuration

1

2

3

Answer 01 - 06

Correct Answer:

Actions

Add a code component.

Edit the dog form.

Form configuration

1

Edit the resident form.

2

Select the lookup.

3

Add a form component.

To allow care staff to update the **Dog Weight** from the **Resident** record, you need to display fields from the related **Dog** table on the **Resident** form.

The correct sequence is:

1. **Edit the resident form**
2. **Select the lookup**
3. **Add a form component**

Explanation

- The weight field belongs to the **Dog** table, not the **Resident** table.
- The Resident table contains a **lookup to Dog**.
- In a model-driven app, you can expose and edit fields from a related record by adding a **Form Component Control** to the lookup on the parent form

Reference: <https://www.examttopics.com/discussions/microsoft/view/157035-exam-pl-200-topic-2-question-56-discussion/>

Question 01 – 07

You need to create adoption duties for the administrative staff.

What should you create?

- A. business unit
- B. business process flow
- C. business rule

Answer 01 - 07

Correct Answer: B

Explanation

The requirements describe a **series of adoption duties that must be completed in order**:

- Commitment
 - Obtain adopter signature
 - Collect deposit
- Pre-pickup
 - Document spay/neuter date
 - Perform spay/neuter
 - Document pickup date
- Pickup
 - Collect full payment
 - Verify dog is picked up

A **Business Process Flow (BPF)** is specifically designed to:

- Guide users through a sequence of stages and steps.
- Enforce a consistent process.
- Display the required activities on the form.
- Ensure users complete tasks in the proper order.

Why not the others?

- **A. Business unit**
Used for security and organizational structure, not process guidance.
- **C. Business rule**
Used for field validation, visibility, requirements, and calculations, but not for guiding users through multiple stages of a process.

Reference: <https://www.examttopics.com/discussions/microsoft/view/157030-exam-pl-200-topic-3-question-48-discussion/>

Question 01 – 08

You need to manage contact duplicates for the administrative staff.

What should you do?

- A. Create two duplicate detection rules and two duplicate detection jobs, and update duplicate detection settings.
- B. Create two duplicate detection rules and one duplicate detection job.
- C. Create one duplicate detection rule and one duplicate detection job, and update duplicate detection settings.

Answer 01 - 08

Correct Answer: C

Explanation

The scenario states:

- Contacts are duplicates when they have the **same Email Address and Last Name**.
- Administrative staff must receive a **weekly list of duplicate contacts**.
- **Duplicate alerts must not appear when a user saves a new contact**.

To satisfy this:

1. **Create one duplicate detection rule** on the Contact table:
 - Email Address = Exact Match
 - Last Name = Exact Match
2. **Create one duplicate detection job:**
 - Run weekly to identify duplicates and provide the list to administrative staff.
3. **Update duplicate detection settings:**
 - Disable duplicate detection during create/update operations so users do not receive duplicate warnings when saving contacts.

Why not the others?

- **A. Two duplicate detection rules and two duplicate detection jobs**
Only one duplicate definition exists (Email + Last Name), so a single rule and job are sufficient.
- **B. Two duplicate detection rules and one duplicate detection job**
Multiple rules are unnecessary because the duplicate criteria are clearly defined as a single combination.

Reference: <https://www.examttopics.com/discussions/microsoft/view/157031-exam-pl-200-topic-3-question-49-discussion/>

Question 01 – 09

You need to ensure that an appropriate date is selected for dog pickup.

What should you configure? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Component and formula configuration

Component

▼

Flow

Business rule

Formula column

Whole number calculated column

Formula

▼

DIFFINDAYS(cs_spay_or_neuter_date, cs_pickup_date)

If(Datediff('Spay and neuter date','Pickup date')>2,"Yes","No")

(Pickup date Is more than [Spay or neuter date + 2])

Answer 01 - 09

Correct Answer:

Component and formula configuration

Component	Flow Business rule Formula column Whole number calculated column
Formula	DIFFINDAYS(cs_spay_or_neuter_date, cs_pickup_date) If(Datediff('Spay and neuter date','Pickup date')>2,"Yes","No") (Pickup date Is more than [Spay or neuter date + 2])

Component: Business rule

Formula (Condition):

(Pickup date Is more than [Spay or neuter date + 2])

Why?

The requirement states:

"A dog must be picked up no sooner than two days after spaying or neutering."

"A pop-up window must appear with an error message if the Pickup date is too soon."

A **Business Rule** is the correct component because it can:

- Validate data on the form in real time.
- Show an **error message** to the user.
- Prevent invalid data entry without code.

The condition should verify that the **Pickup date** is at least **2 days after** the **Spay or neuter date**.

Reference: <https://www.examttopics.com/discussions/microsoft/view/157032-exam-pl-200-topic-3-question-50-discussion/>

Question 01 – 10

You need to create reminders for the adopters.

What should you use for each requirement? To answer, select the appropriate options in the answer area.

Components used for requirements

Trigger type

▼

Automated
Instant
Scheduled

Connector

▼

Dataverse
Outlook
Microsoft Bookings

[Answer 01 - 10](#)

Correct Answer:

Components used for requirements

Trigger type

▼

Automated
Instant
Scheduled

Connector

▼

Dataverse
Outlook
Microsoft Bookings

The reminder email must:

- Be sent **2 hours before a meeting**.
- Be sent automatically.
- **Not be tracked** in Dataverse.
- Exchange server-side synchronization is **not configured**.

A **Scheduled** Power Automate flow can run periodically, identify upcoming meetings, and send reminder emails at the appropriate time.

Using the **Outlook** connector sends the email directly through Outlook and avoids creating/tracking email activities in Dataverse.

Reference: <https://www.examtactics.com/discussions/microsoft/view/157027-exam-pl-200-topic-6-question-25-discussion/>

CASE 02 BELLOWS COLLEGE

Background -

Bellows College is a post-secondary school that wants to start a football team. The college uses Microsoft Power Platform to manage its recruiting efforts. The registration team and assistants use model-driven apps. The coaches use canvas apps on their mobile devices.

Prospects are considered underage if they are younger than 18 years old at the time of registration.

Current environment -

Environment -

- Custom code is not allowed in the system.
- Server-side synchronization is configured for emails, appointments, contacts, and tasks.
- The database and file storage of Dataverse must be minimized to keep costs low.

Contact table -

- Birthdate is a custom date and time field.
- Age at Registration is a calculated field that displays the age of the prospect at the time of registration.
- Current Age is a calculated field that displays the age of the prospect based on the current date and time.

Evaluation table -

- The Evaluation table is a custom table used to track evaluation criteria.
- Evaluation records cannot be manually created.
- Users must not be able to continue until an evaluation record is created automatically for the prospect.

Consent table –

- The consent forms completed by the parents are stored as records in the Consent table.
- Occasionally, a parent cannot complete the consent online and a paper copy must be printed. The signed copy must be scanned and stored with the consent record.

Team website –

- The team website is created by using Power Pages.
- A starter layout template was used to create the site.
- The site consists of five pages:
 - Home: A page open to everyone to view the announcements from the team.
 - Schedule: A page open to everyone to view the tryout and game schedule.
 - Evaluations: A page that displays tracking from the evaluation table. Prospects are able to view their own information only.
 - Forms: A page that displays the consent form.
 - Contact Us: A page for anyone to submit questions and comments.
- Two web roles for authenticated users are created: Primary Contact User and Prospect User.
 - All primary contacts and prospects are assigned to their respective roles.

Requirements –

Registration –

- Parents and prospects are created as contacts and must be linked.
- The registration team must be able to rapidly create prospects without navigating away from the Parents form. Only the First Name, Last Name, and Birthdate fields should be displayed for the team.
- Assistants must be able to update prospect information and add teams that the prospect has previously played on to a subgrid.

Parental consent -

- When a prospect is underage, a Primary Contact field will appear. The field must be populated before the prospect record can be saved.
- A view named Underage Prospects that lists all underaged prospects is required.
- The Underage Prospects view must run once a week without requiring modifications to display correct information.
- A consent email must meet the following requirements:
 - be sent to the primary contact of each new underage prospect

- contain a link to the team website or be automatically sent weekly and tracked to the contact record in Dataverse
- include the current date using the full month name, date, and year

Evaluations -

- Coaches rate prospects each day on a scale of 1-10 in three categories: endurance, coordination, and skill.
- The total of the three categories is displayed at the bottom of the form. If the total for the day is greater than 25, the number should appear green.

Question 02 - 01

You need to view website questions and comments.

Where should you view this information?

- A. Evaluations
- B. Lead
- C. Contact
- D. Feedback

Answer 02 - 01

Correct Answer: D

In Power Pages (formerly Power Apps Portals), the **Feedback** table is used to capture feedback, comments, and ratings submitted by users through portal pages.

The scenario includes:

Contact Us: A page for anyone to submit questions and comments.

Questions and comments submitted from a portal's Contact Us page are typically stored and viewed as **Feedback** records.

Why the other options are incorrect

- **A. Evaluations** – Used to track prospect evaluation scores, not website inquiries.
- **B. Lead** – Used for prospective customers/sales opportunities, not portal comments.
- **C. Contact** – Stores person records (parents, prospects, etc.), not the submitted questions/comments themselves

Reference: <https://www.examttopics.com/discussions/microsoft/view/139464-exam-pl-200-topic-2-question-44-discussion/>

Question 02 - 02

You need to set up webpage permissions.

Which permissions must you set? To answer, move the appropriate permissions to the correct page. You may use each permission once, more than once, or not at all. You may need to move the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Permissions

Prospect User

Primary Contact User

Anyone can see this page

Webpage permissions

Home

Schedule

Evaluations

Forms

Answer 02 - 02

Correct Answer:

Permissions

Webpage permissions

Home

Anyone can see this page

Schedule

Anyone can see this page

Evaluations

Prospect User

Forms

Primary Contact User

Based on the scenario:

- **Home:** "A page open to everyone to view the announcements from the team."
- **Schedule:** "A page open to everyone to view the tryout and game schedule."
- **Evaluations:** "Prospects are able to view their own information only."

- **Forms:** Displays the parental consent form. This is intended for the parent (Primary Contact) to complete.

Reference: <https://www.examttopics.com/discussions/microsoft/view/140625-exam-pl-200-topic-2-question-45-discussion/>

Question 02 - 03

You need to create forms required for the registration team and assistants.

Which form types should you create? To answer, move the appropriate form types to the correct roles. You may use each form type once, more than once, or not at all. You may need to move the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Form types	Form types required for roles
Card	Registration team
Main	
Edit	Assistants
Quick create	

Answer 02 - 03

Correct Answer:

Form types

Card
Edit

Form types required for roles

Registration team

Quick create

Assistants

Main

Based on the requirements:

Registration team

"Must be able to rapidly create prospects without navigating away from the Parents form. Only the First Name, Last Name, and Birthdate fields should be displayed."

This is exactly the purpose of a **Quick Create** form.

Registration team → Quick create

Assistants

"Must be able to update prospect information and add teams that the prospect has previously played on to a subgrid."

Subgrids and full record editing require a **Main** form.

Assistants → Main

Reference: <https://www.examttopics.com/discussions/microsoft/view/140626-exam-pl-200-topic-2-question-46-discussion/>

Question 02 - 04

You need to configure the Total field on the Evaluation form.

Which property should you select for the formula? To answer, move the appropriate property to the correct formula. You may use each property once, more than once, or not at all. You may need to move the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Properties**Property and its formula**

Sum(Endurance.Text,Coordination.Text,Skill.Text)

If(Value(Total.Text) > 25, Color.Green, Color.Black)

Answer 02 - 04

Correct Answer:**Properties****Property and its formula**

Sum(Endurance.Text,Coordination.Text,Skill.Text)

If(Value(Total.Text) > 25, Color.Green, Color.Black)

The Total field needs to:

1. **Display the sum** of Endurance, Coordination, and Skill.
 - The result shown in the label/control is controlled by the Text property.
2. **Turn green when the total is greater than 25.**
 - The text color is controlled by the Color property.

Reference: <https://www.examttopics.com/discussions/microsoft/view/140627-exam-pl-200-topic-2-question-47-discussion/>

Question 02 - 05

You need to create the evaluation record for a prospect.

What should you use?

- A. a classic Dataverse workflow
- B. a cloud flow
- C. a plug-in
- D. a quick create form

Answer 02 - 05

Correct Answer: B

The scenario states:

- Evaluation records cannot be manually created.
- Users must not be able to continue until an evaluation record is created automatically for the prospect.
- Custom code is not allowed in the system.

Let's evaluate the options:

- Classic Dataverse workflow (Incorrect): Classic workflows are legacy functionality. While they can create records, Microsoft's recommended approach for new automation is Power Automate (cloud flows).
- Cloud flow (Correct): A Power Automate cloud flow can trigger when a Prospect record is created and automatically create the corresponding Evaluation record without custom code.
- Plug-in (Incorrect): A plug-in could enforce synchronous creation, but the scenario explicitly states custom code is not allowed.
- Quick create form (Incorrect): A Quick Create form facilitates manual record creation, which contradicts the requirement that Evaluation records be created automatically.

Reference: <https://www.examttopics.com/discussions/microsoft/view/139467-exam-pl-200-topic-2-question-48-discussion/>

Question 02 - 06

You need to create a filter for the Underage Prospects view.

How should you set up the expression for the filter? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Underage Prospect filter

▼ Birthdate Created On Current Age Age at Registration	▼ Last x years Is less than Is greater than Older than x years	18
--	--	----

Answer 02 - 06

Correct Answer:

Answer Area

Underage Prospect filter

▼ Birthdate Created On Current Age Age at Registration	▼ Last x years Is less than Is greater than Older than x years	18
--	--	----

The requirement is:

- A prospect is underage if younger than 18 at the time of registration.
- The Underage Prospects view must automatically remain correct over time and run without manual updates.
- The table already contains a calculated field Age at Registration, which stores the age when the prospect registered.

Since the rule is based on age at registration, not current age, the view should filter on Age at Registration

Reference: <https://www.examttopics.com/discussions/microsoft/view/140220-exam-pl-200-topic-3-question-38-discussion/>

Question 02 - 07

You need to create a flow to send an email to the primary contacts.

Which action should you configure? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Flow actions

Select a flow trigger

▼

Recurrence
Manually trigger a flow
When a row is added, modified, or deleted

Find primary contact

▼

List rows
Condition
Get a row by ID

Create email

▼

Add a new row
Perform a bound action
Send an email (V2)
Send an email notification (V3)

Answer 02 - 07

Correct Answer:

Answer Area

Flow actions

Select a flow trigger

Recurrence
Manually trigger a flow
When a row is added, modified, or deleted

Find primary contact

List rows
Condition
Get a row by ID

Create email

Add a new row
Perform a bound action
Send an email (V2)
Send an email notification (V3)

For the consent email requirement:

- It must be **automatically sent weekly** → use a **Recurrence** trigger.
- It must be sent to the **primary contact of each underage prospect** → retrieve matching records with **List rows**.
- It must be **tracked to the contact record in Dataverse** → create an Email activity record rather than sending an untracked notification, so use **Add a new row** (Email table)

Reference: <https://www.examttopics.com/discussions/microsoft/view/140629-exam-pl-200-topic-3-question-39-discussion/>

Question 02 - 08

You need to configure the Primary Contact field.

What should you configure? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Field configuration

Primary Contact data type	▼ Choice Lookup Text
Visibility	▼ Business rule where the Set Visibility action is Yes Business rule where the Set Visibility action is No Hide option for the Primary Contact field on the card form Hide option for the Primary Contact field on the quick view form
Requirement	▼ Business rule where the Business Required action is Business Required Business rule where the Business Required action is Not Business Required Required option as Business required on the column Required option as Business recommended on the column

Answer 02 - 08

Correct Answer:

Answer Area

Field configuration

Primary Contact data type	▼ Choice Lookup Text
Visibility	▼ Business rule where the Set Visibility action is Yes Business rule where the Set Visibility action is No Hide option for the Primary Contact field on the card form Hide option for the Primary Contact field on the quick view form
Requirement	▼ Business rule where the Business Required action is Business Required Business rule where the Business Required action is Not Business Required Required option as Business required on the column Required option as Business recommended on the column

Primary Contact data type = Lookup

- Parents and prospects are both stored as **Contact** records and must be linked.
- Therefore, the Primary Contact field should be a **Lookup** to the Contact table.

Visibility = Business rule where Set Visibility = Yes

- Requirement: *"When a prospect is underage, a Primary Contact field will appear."*
- Use a **Business Rule** that checks the prospect's age and sets the field visibility to **Yes** when the prospect is under 18.

Requirement = Business rule where Business Required = Business Required

- Requirement: *"The field must be populated before the prospect record can be saved."*
- Use the same Business Rule to make the field **Business Required** when the prospect is underage.

Reference: <https://www.examttopics.com/discussions/microsoft/view/139474-exam-pl-200-topic-4-question-32-discussion/>

Question 02 - 09

You need to format the Current Date field for parental consent.

What should you use?

- A. switch
- B. dynamic content
- C. expression
- D. condition

Answer 02 - 09

Correct Answer: C

The requirement is to include the **current date** in the consent email using the format:

Full month name, day, and year

*Example: **July 20, 2026***

In **Power Automate**, custom date formatting is done by using an **Expression**, such as:

formatDateTime(utcNow(),'MMMM dd, yyyy')

- **Expression** (Correct) Used to format dates and manipulate values.
- **Dynamic content** (Incorrect) Inserts values, but by itself does not provide custom formatting.
- **Condition** (Incorrect) Used for branching logic.
- **Switch** (Incorrect) Used for multiple branching scenarios.

Reference: <https://www.examttopics.com/discussions/microsoft/view/140634-exam-pl-200-topic-6-question-18-discussion/>

Question 02 - 10

You need to store scanned consent forms.

Where should you store the forms?

- A. Attachment
- B. Column
- C. Notes
- D. SharePoint

Answer 02 - 10

Correct Answer: D

The case explicitly states:

"The database and file storage of Dataverse must be minimized to keep costs low."

Scanned consent forms are documents that can consume significant storage. Microsoft best practice is to store documents in **SharePoint** and link them to Dataverse records through SharePoint integration.

Why not the others?

- **A. Attachment** (Incorrect) Uses Dataverse storage.
- **B. Column** (Incorrect) File/Image columns consume Dataverse file storage.
- **C. Notes** (Incorrect) Attachments in notes are stored in Dataverse and increase storage costs.
- **SharePoint** (Correct) Optimizes storage costs and is the recommended document repository for Dataverse apps.

Reference: <https://www.examttopics.com/discussions/microsoft/view/140635-exam-pl-200-topic-6-question-19-discussion/>

CASE 03 CITY POWER & LIGHT

Background -

City Power & Light is an energy and utilities company that has offices in Europe. The company subsidizes home improvements for domestic customers, to improve energy efficiency and to meet environmental commitments. The company also distributes and generates electricity for domestic and commercial customers. The company has 2,000 employees in multiple offices and in work-from-home locations.

City Power & Light uses a team of schedulers, assessors, field engineers, and customer support agents for home improvements in a program named Get Energy Fit.

Current environment -

Get Energy Fit Program-

City Power & Light uses the following to manage the Get Energy Fit program:

- The company uses a Microsoft Excel spreadsheet named Planning Hub on Microsoft SharePoint Online to store information about customer appointments, customer details, and customer eligibility in the program.
- The company records sensitive customer information that includes the document identification numbers and the customer's financial information.
- The company uses an assessor to verify customer eligibility in the program and to perform a suitability assessment. The assessor completes the suitability assessment by using a paper and clipboard at the customer property and enters the data to the Planning Hub after the assessment is completed. The assessor also uploads photographs to an on-premises document library. The assessor completes the eligibility assessment by using an application written in React.
- Schedulers use Microsoft Outlook to schedule engineers and assessors for home improvement appointments. About 200 appointments are scheduled daily.
- Employees for the company submit funding claims on behalf of the customer by uploading evidence and compliance checks information to an application named the Claim Submission Portal.

Technical Environment -

- Schedulers use Windows 11 desktop and laptop computers with the latest version of Microsoft Edge.
- Assessors use iOS and Android tablet devices.
- The Claim Submission Portal uses REST-based APIs for all operations and a dedicated testing environment. Authentication to the API is provided by using the following example header key and value pair:
 - Authentication: 2C8D41431415E429C7FC7A74D8315
- The company uses Microsoft Azure for hosting multiple applications..

Requirements –

Overview-

City Power & Light plans to implement Microsoft Power Platform to improve the customer experience and increase delivery for the Get Energy Fit program.

Business Requirements-

- Only team leaders and senior managers should have access to read personally identifiable

information (PII).

- All development changes must be tested in a separate environment.
- The company requires out-of-the-box solutions, when possible.
- Sensitive credentials, such as user passwords and API secrets, must be stored securely.
- The Claim Submission Portal must allow citizen developers to create automated solutions.
- Customer and appointment information must be accessible to all applications.

Planning Hub Application-

The company is planning to replace the Planning Hub spreadsheet with a new application. The new application has the following requirements:

- The application must support a component design that provides rapid changes requested by the schedulers.
- The data model for the application must capture the following information:
 - Information about customers such as name, address, and other PII.
 - The data and time for an assessor's or engineer's appointment. Schedulers must be able to view all appointments without filters.
 - Records the details of the home improvements installed for the customer.
 - Contains all the information and evidence for submission to the Claim Submission Portal.
- After an assessor uploads the funding application and all evidence after a home improvement has been complete, the company requires that the status of the application is set to Submit and should run the following:
 - Retrieve the details about the customer and the improvement installed.
 - Send an approval to a senior manager to review and approve in Microsoft Teams.
 - Upload the information to the API endpoint.
 - If the upload fails to complete, it should retry after a delay of 30 seconds up to three times. If an error occurs after three times, the application should send an email notification to the application support team.
 - Must record the status on the funding application.

Suitability Assessment Tool-

The company plans to implement a new application named the Suitability Assessment Tool for the assessors. The new application has the following requirements:

- Must integrate with Microsoft Power Platform.
- Assessors must be able to complete the eligibility assessment by using the Suitability Assessment Tool. The assessors must be able to upload photographs to the on-premises file share.
- Must be developed by using modular components that can be used by other applications.
- Must be optimized for use on tablet devices.
- All changes to the application must be completed in the Suitability Assessment Tool solution.

Reporting-

The company has the following requirements for a reporting solution:

- The data source for the reporting solution must support incremental refreshes.
- The solution must report accurate data if an error occurs.

Issues-

- A recent audit identified that all users can access the PII in the Planning Hub spreadsheet.
- After a developer deploys a change to the production environment, a user reports information is loaded incorrectly to the test system when processing a funding application.
- After deploying a change to the new eligibility assessment tool in the development environment, you observe that the changes do not appear in the development environment.
- After removing a column from the Planning Hub application and deploying the changes to the production environment, you observe that the column is still present.
- You deploy the customizations for the data model. Users report that the email address of the user who created the appointment is missing and that searches on the description information do not return any results.

Question 03 - 01

You need to deploy the changes and resolve the issue with the Planning Hub application.

What should you use? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Planning Hub application requirements

Requirement

Solution to deploy

Solution

Appointment data
Claim submission portal
Spreadsheet
Suitability Assessment Tool

How to export

Export the unmanaged solution as managed
Export the unmanaged solution as unmanaged

Remove the column after the deployment

Publish all customizations
Stage for Upgrade
Update
Upgrade

Answer 03 - 01

Correct Answer:

Planning Hub application requirements

Requirement

Solution to deploy

Solution

Appointment data
Claim submission portal
Spreadsheet
Suitability Assessment Tool

How to export

Export the unmanaged solution as managed
Export the unmanaged solution as unmanaged

Remove the column after the deployment

Publish all customizations
Stage for Upgrade
Update
Upgrade

For the **Planning Hub application**:

1. Solution to deploy → Appointment data

The issue mentions:

"After removing a column from the Planning Hub application and deploying the changes to the production environment, you observe that the column is still present."

To support ALM and deployment to production, the Planning Hub should be deployed as a **managed solution**.

(The Planning Hub application contains customer, appointment, and improvement data.)

2. How to export → Export the unmanaged solution as managed

Production deployments should use a **managed solution**.

3. Remove the column after deployment → Stage for Upgrade

When a component (such as a column) is removed from a managed solution, the correct approach is to use **Stage for Upgrade** and then apply the upgrade. This removes deleted components from the target environment.

Reference: <https://www.examtactics.com/discussions/microsoft/view/307896-exam-pl-400-topic-2-question-58-discussion/>

CASE 04 ADATUM

Background -

ADatum Corporation provides verification and investigation services that are used by insurance companies, law firms, and other organizations in the public sector. Services include verifying an individual's background, qualifications, and specific scenarios that require onsite visit.

The thorough work ADatum Corporation performs results in highly accurate cases with minimal critical information missing. Because of these high-quality results, ADatum Corporation is quickly proving itself as one of the best in the industry. In recent months, business has significantly increased, with most new business coming from high-profile companies and individuals.

Management has decided to create a new qualification verification (QV) role to help ensure that clients get the most accurate results. This role examines completed work to ensure that nothing is missed.

Current environment -

Data storage and retention –

- All information sent by clients for services is stored in Microsoft Dataverse with a model-driven app as the interface.
- Clients enter their data in a website, which then uses a service account to create the records in the Dataverse database.

- Team members currently have full access to all Service Request records..

Service Requests –

- The Service Request table includes header information about the individual or organization that is the subject of verification.
- New Service Request records are assigned to a queue. All potential users who will be performing the verifications have access to these records.
- A service request is assigned to a single user who will ensure that all qualifications are verified. This single user is the only one able to process Qualification records related to their own service requests.
- Many required tasks when performing verification services are currently done by using manual processes.
- To keep up with demand, ADatum Corporation identifies several processes that can be replaced by using Power Automate flows to hire fewer new staff and keep costs down.

Qualification verification –

- The qualification table contains details about an individual school degree, professional qualifications, and other qualifications that must be verified.
- A service request can have one or more Qualification records associated with it.
- Record status is pending verification until the initial team member finishes, at which point the member changes the status to Complete.
- When all qualification records related to a service request are verified either by manual or automated processes, the results are made available to ADatum Corporation's client.
- In the rare event that results are questioned, a new service request is created and verified independently of the previous work that took place.
- To complete a service request, users perform the following actions:
 - o Send a templated email by using Microsoft Outlook to the client after all qualifications for a service request are checked.
 - o Change the service request status to Completed. Currently, service requests do not indicate when all Qualification records are addressed.

Microsoft Power platform environment

- The following environments exist: development, testing, user acceptance testing (UAT), and production.
- Managed solutions are used to move customizations from the development environment to other higher-level environments. These solutions are created and maintained by the power users and provided to internal IT for deployment when they are ready.
- Two managed solutions, Verification Process Automation and Onsite Visit, share several components.

- All customizations to Power Platform components are performed by several power users who have received training and are certified as subject matter experts.
- Power users have been granted the System Administrator security role in the development environment.
- Corporate policy prohibits power users from writing code due to lack of a formal code review process.
- Internal IT will not be able to supply any development resources for this project due to a lack of staff. This means that any customizations and automation created for this project must be low-code/no-code for the power users to implement them.

Customizations created by power users are deployed by internal IT.

Requirements -

Process automation –

ADatum Corporation plans to establish a new QV department to verify completed work so that the quality of work is maintained. The new process for verifying professional qualifications must automate the following:

- Enter data and navigate the authority's website. The authority website UI changes frequently because the company constantly improves the user experience.
- Search page contents for a specified value to determine validity.
- Update the corresponding Qualification record in Dataverse.

The new process for completing a service request must automate the following:

- Set the Service Request record status to Complete when work on all Qualification records is finished.
- Send an email to the client with the results when the service request is completed. The email must list each qualification as either Valid or Not Valid, depending on the verification.

Qualification verification -

- Service request results will not be released to clients until all related Qualification records are set to a Complete status.
- To check work done by a wide array of users, 10 percent of Qualification records must be double checked.
- Qualification records must be automatically assigned to a queue.
- Qualification records must be flagged with a new status field named Assigned to ensure that records are rechecked.
- Ensure that only QV team members can change the status from Assigned to In Progress to Complete.
- Record the name of the QV team member who performed the work and the date completed.

Governance and security –

- All components required for the verification process must be included in a new solution.
- Corporate security requires that deployments to non-development environments must be automated using service accounts.
- User security and data access must also be consistent across environments, except for the elevated access of the power users in the development environment.
- The Onsite Visit managed solution has a table that is not in the Verification Process Automation managed solution. This table must be upgraded prior to the go-live date without the other shared components.
- A VP of sales requires a test environment to demonstrate to potential clients the security policies that are included in their initial offering.

Issues -

- More employees than are required can access individual client information and continue to have access after a service request is completed.
- When users go on vacation, all their outstanding Service Request records are assigned to a substitute employee. The substitute employees are unable to see all the qualifications related to their service requests.
- Currently, testing the new QV functionality outside the development environment is not possible due to corporate security policies requiring the same security role across all environments.
- Internal IT reports that the solution import to the test environment failed because of missing dependencies related to the flow for completing service requests.

Question 04 - 01

You need to create the automation for the qualification verification process.

Which two actions should you perform? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. Add a Dataverse connector.
- B. Add an Outlook connector.
- C. Create an on-premises data gateway reference.
- D. Update the Qualification records to finished.
- E. Create a Service Request record.

Answer 04 - 01

Correct Answer: A,C

A. Add a Dataverse connector

- The automation must update the corresponding **Qualification** record in Dataverse.
- Use the Dataverse connector to update the Qualification status/result.

C. Create an on-premises data gateway reference

- The process must interact with an external authority website by entering data, navigating pages, and reading page contents.
- This type of UI automation typically requires a desktop/UI flow connection through a gateway or machine connection so the automation can run against the website.

Why the others are not correct

- **B. Add an Outlook connector**

Outlook is needed for sending client emails when the service request is completed, not for qualification verification.

- **D. Update the Qualification records to finished**

Updating the record is the result of the automation, but the required configuration action is to use the **Dataverse connector**.

- **E. Create a Service Request record**

A new service request is only created if results are questioned later, not during normal qualification verification.

Reference: <https://www.examttopics.com/discussions/microsoft/view/145216-exam-pl-200-topic-3-question-42-discussion/>

Question 04 - 02

You need to address the executive's concerns regarding unnecessary data access.

Which security changes should you make? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Concern – Unnecessary user access to client data during verification

Security Measure –

Assign records to the user doing the verification and change table security to basic.
Assign records to a service account and share the record with the team member doing the verification.
Assign records to a service account and add the team member doing the verification by using an access team.

Concern – Unnecessary user access to client data after the request is completed

Security Measure –

Assign records to the QV team when the service request is completed.
Assign records to a service account when the service request is completed.
Assign records to the team member doing the verification when the service request is completed.

Answer 04 - 02

Correct Answer:

Answer Area

Concern – Unnecessary user access to client data during verification

Security Measure –

Assign records to the user doing the verification and change table security to basic.
Assign records to a service account and share the record with the team member doing the verification.
Assign records to a service account and add the team member doing the verification by using an access team.

Concern – Unnecessary user access to client data after the request is completed

Security Measure –

Assign records to the QV team when the service request is completed.
Assign records to a service account when the service request is completed.
Assign records to the team member doing the verification when the service request is completed.

Concern — Unnecessary user access to client data during verification

- **Security Measure:** → Assign records to a service account and add the team member doing the verification by using an access team.

Why?

- Access Teams provide temporary, record-level access.
- The verifier only gets access to the specific Service Request being worked on.
- The record remains owned by the service account, minimizing unnecessary exposure.

Concern — Unnecessary user access to client data after the request is completed

Security Measure: → Assign records to a service account when the service request is completed.

Why?

- Returning ownership to the service account removes access that was granted through assignment.
- This ensures employees do not retain access after their work is finished.

Reference: <https://www.examttopics.com/discussions/microsoft/view/83377-exam-pl-200-topic-7-question-1-discussion/>

Question 04 - 03

You need to resolve the issue reported by substitute employees after they are assigned service requests. How should you configure the system? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Aspect

Configuration

Relationship

	▼
Service Request 1:N Qualification	
Service Request N:N Qualification	
Service Request N:1 Qualification	

Cascading rule

	▼
Restrict	
Cascade All	
Cascade None	

Answer 04 - 03

Correct Answer:

Answer Area

Aspect

Configuration

Relationship

Service Request 1:N Qualification

Service Request N:N Qualification

Service Request N:1 Qualification

Cascading rule

Restrict

Cascade All

Cascade None

The issue states:

"When users go on vacation, all their outstanding Service Request records are assigned to a substitute employee. The substitute employees are unable to see all the qualifications related to their service requests."

A Service Request can have one or more Qualification records, so the relationship is:

Service Request 1:N Qualification:

When ownership of a Service Request changes, the related Qualification records must also transfer ownership/access to the substitute employee.

Cascade All:

This ensures that assign, share, reparent, and other ownership-related actions are cascaded from the Service Request to its associated Qualification records.

Reference: <https://www.examttopics.com/discussions/microsoft/view/83459-exam-pl-200-topic-7-question-2-discussion/>

Question 04 - 04

You need to implement the requirement for the VP of sales.
What should you do?

- A. Use a test account with a base security role with QV security added.
- B. Add the System Administrator security role to your user account.
- C. Use a test account with only QV security added.
- D. Add QV security to your user account.

Answer 04 - 04

Correct Answer: A

The requirement is:

"A VP of sales requires a test environment to demonstrate to potential clients the security policies that are included in their initial offering."

And the issue states:

"Testing the new QV functionality outside the development environment is not possible due to corporate security policies requiring the same security role across all environments."

To demonstrate the security model properly, you should test with a **representative user account**, not with an administrator account.

- A **base security role** provides the normal user permissions.
- The **QV security role** adds the permissions specific to Qualification Verification.
- Using a test account accurately reflects how an end user would experience the system.

Why not the others?

- **B. Add the System Administrator security role to your user account**
System Administrator bypasses security restrictions and would not demonstrate the actual security model.
- **C. Use a test account with only QV security added**
The QV role would typically supplement a base role rather than replace standard access.
- **D. Add QV security to your user account**
Your existing account likely has elevated privileges, making it unsuitable for validating user-level security.

Reference: <https://www.examttopics.com/discussions/microsoft/view/83460-exam-pl-200-topic-7-question-3-discussion/>

Question 04 - 05

You create a desktop flow to interact with a certification authority's website.

You need to get data in and out of the desktop flow.

How should you set up the input and output parameters? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Parameter direction	Configuration
Inbound	Copy and paste qualification data into the desktop flow. Run a cloud flow from the Dataverse qualification record to send data to the desktop flow. Connect by using the Dataverse connector from the desktop flow and retrieve the qualification data.
Outbound	Copy and paste the verification data into the qualification record. Send data from the desktop flow to a cloud flow to update the qualification record. Connect by using the Dataverse connector from the desktop flow and the qualification record

Answer 04 - 05

Correct Answer:

Answer Area

Parameter direction	Configuration
Inbound	Copy and paste qualification data into the desktop flow. Run a cloud flow from the Dataverse qualification record to send data to the desktop flow. Connect by using the Dataverse connector from the desktop flow and retrieve the qualification data.
Outbound	Copy and paste the verification data into the qualification record. Send data from the desktop flow to a cloud flow to update the qualification record. Connect by using the Dataverse connector from the desktop flow and the qualification record

Explanation:

For a **Power Automate Desktop flow**, the recommended pattern is:

- A **cloud flow** retrieves the Dataverse record and passes values into the desktop flow using **input parameters**.
- The **desktop flow** returns results using **output parameters** to the cloud flow.
- The **cloud flow** then updates Dataverse.

Why?

- Desktop flows do not typically access Dataverse directly for ALM and governance scenarios.
- The standard RPA pattern is **Cloud Flow** → **Desktop Flow** → **Cloud Flow** → **Dataverse**.
- This keeps connections, security, and Dataverse updates centralized in the cloud flow.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/83393-exam-pl-200-topic-9-question-2-discussion/>

Question 04 - 06

You need to configure a Power Automate flow to send the email with the results to the client. What should you use? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Requirement

Process qualification records for a service request.

Evaluate a qualification.

Control

▼
Switch
Condition
Apply to Each

▼
Do until
Condition
Apply to Each

Answer 04 - 06

Correct Answer:

Answer Area

Requirement

Process qualification records for a service request.

Evaluate a qualification.

Control

▼
Switch
Condition
Apply to Each

▼
Do until
Condition
Apply to Each

For this requirement, the flow must:

1. Loop through **all Qualification records** related to a Service Request to build the email content.
2. Check whether each qualification is **Valid** or **Not Valid**.

Explanation:

- **Apply to Each** is used to iterate through the collection of Qualification records associated with the Service Request.
- **Condition** is used inside the loop to determine whether the qualification result is Valid or Not Valid and append the appropriate text to the email.

Discussion: <https://www.examtactics.com/discussions/microsoft/view/83392-exam-pl-200-topic-9-question-3-discussion/>

Question 04 – 07

You need to capture the Date Completed value from the website using a desktop flow. Which method should you use?

- A. Use optical character recognition (OCR) on the screen to locate and extract the value.
- B. Display an input dialog and prompt the user to enter the value.
- C. Extract the value from the window the browser is using.
- D. Retrieve the value from the HTML element in the webpage.

Answer 04 - 07

Correct Answer: D

The requirement is to capture a **Date Completed** value from a website using **Power Automate Desktop**.

- **Retrieve details of a web page / web element** is the most reliable and accurate method because it reads the value directly from the webpage's HTML/DOM.
- **OCR** should only be used when the value cannot be accessed as a web element (for example, an image or remote desktop session).
- **Input dialog** requires manual entry and does not automate the process.
- **Extracting from the browser window** is less precise than reading the specific HTML element.

Additionally, the scenario mentions that the website UI changes frequently. Power Automate Desktop's web automation and element selectors are designed for interacting with webpage elements, making them more robust than screen-based techniques such as OCR.

Discussion: <https://www.examtactics.com/discussions/microsoft/view/83396-exam-pl-200-topic-9-question-4-discussion/>

Question 04 – 08

You need to assign 10 percent of the Qualification records to the QV queue through table configuration by using a Power Automate flow. What should you do?

- A. Create an autonumber column on the Qualification table and assign its qualification records if the number cleanly divides by 10.

- B. Create a calculated column on the Service Request table that sums the number of qualification records, generates a random number between zero and the number from the new field, and assigns each qualification record if the number generated is 10 percent or less of the value of the new field.
- C. Create a roll-up column on the Service Request table that is the count of qualification records, generates a random number between zero and the number from the new field, and assigns each qualification record if the number generated is 10 percent or less of the value of the new field.
- D. Create an autonumber column on the Service Request table and assign its qualification records if the number cleanly divides by 10.

Answer 04 - 08

Correct Answer: A

The requirement is to assign **10% of Qualification records** for rechecking by the QV team using a low-code/no-code approach.

Using an **Autonumber** column on the **Qualification** table provides a predictable sequence of values. A Power Automate flow can evaluate the autonumber and assign records where:

$$\text{Autonumber MOD } 10 = 0$$

This selects approximately **1 out of every 10 Qualification records (10%)**.

Why not the others?

- **B** and **C** rely on generating random values and counts from Service Requests. This does not guarantee a consistent 10% selection of Qualification records and adds unnecessary complexity.
- **D** uses an autonumber on the **Service Request** table, which would assign all qualifications under selected service requests rather than 10% of the **Qualification records** themselves.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/80543-exam-pl-200-topic-9-question-5-discussion/>

Question 04 – 09

You need to configure a Power Automate flow to send the email with the results to the client.

What should you use? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Trigger settings

	▼
Set Table name to Qualification and Column filter to statecode.	
Set Table name to Qualification and Column filter to statuscode.	
Set Table name to Service Requests and Column filter to statuscode.	

Logic to complete service requests

	▼
Complete if current record is in Complete status.	
Complete if current record is in Pending Verification status.	
Loop through related qualification records and complete if all are in Complete status.	

Answer 04 - 09

Correct Answer:

Answer Area

Trigger settings

	▼
Set Table name to Qualification and Column filter to statecode.	
Set Table name to Qualification and Column filter to statuscode.	
Set table name to Service Requests and Column filter to statuscode.	

Logic to complete service requests

	▼
Complete if current record is in Complete status.	
Complete if current record is in Pending Verification status.	
Loop through related qualification records and complete if all are in Complete status.	

For this scenario, the email should be sent **when Qualification records are completed**, because the Service Request is only completed after verifying that **all related Qualification records are Complete**

Why?

- **statuscode** tracks the specific status values (Pending Verification, Complete, etc.), making it the correct column to monitor.
- When a Qualification record changes to Complete, the flow should check all related Qualification records for the Service Request.
- Only if **all** related Qualification records are Complete should the Service Request be marked Complete and the email sent to the client.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/80545-exam-pl-200-topic-9-question-6-discussion/>

Question 04 - 10

You need to set up the new service request completion process.

Which two components should you include in the solution? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. connection reference
- B. business process flow
- C. Power Automate flow
- D. connection

Answer 04 - 10

Correct Answer: A,C

Explanation

The new service request completion process must:

- Detect when all related Qualification records are completed.
- Update the Service Request status to **Complete**.
- Send an email to the client with the qualification results.
- Be deployed through **managed solutions** across environments.

C. Power Automate flow

A Power Automate flow is required to automate the business process:

- Check related Qualification records.
- Update the Service Request record.
- Send the completion email.

A. Connection reference

The scenario mentions that solution imports failed because of **missing dependencies related to the flow** and that deployments must be automated across environments. Connection references are the ALM-friendly way to manage connectors inside solutions and allow connections to be configured per environment during deployment.

Why not the others?

- **B. Business process flow**

A business process flow guides users through stages but does not automate sending emails or updating records based on related records.

- **D. Connection**

Connections themselves are environment-specific and are not included in solutions. A **connection reference** should be used instead..

Discussion: <https://www.examttopics.com/discussions/microsoft/view/79404-exam-pl-200-topic-11-question-1-discussion/>

Question 04 - 11

You need to add the missing components to the Verification Process Automation solution. Which two components should you add? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. Service Request statuscode field
- B. Dataverse connection reference
- C. Qualification statuscode field
- D. On-premises data gateway reference
- E. Outlook connection reference

Answer 04 - 11

Correct Answer: B,E

Explanation

The issue states:

"Internal IT reports that the solution import to the test environment failed because of missing dependencies related to the flow for completing service requests."

The service request completion flow must:

1. Read and update **Dataverse** records (Service Request and Qualification tables).
2. Send emails through **Outlook**.

When a flow is included in a solution, the associated connectors must be represented by **connection references** so they can be configured in each environment during deployment.

Why the others are incorrect

- **A. Service Request statuscode field**
The status field is part of the table schema and not typically the missing dependency causing flow import failures.
- **C. Qualification statuscode field**
Same reasoning as A; fields are not the connector dependencies referenced by the flow.
- **D. On-premises data gateway reference**
The scenario uses Dataverse and Outlook cloud services, not on-premises data sources.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/79413-exam-pl-200-topic-13-question-1-discussion/>

Question 04 - 12

Exam PL-200 topic 13 question 2 discussion

Actual exam question from Microsoft's [PL-200](#)

Question #: 2

Topic #: 13

HOTSPOT -

You need to coordinate updates and deployment for managed solutions containing completed work without disrupting the system.

What should you do? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Deployment option for changes to an unrelated table

Deploy a patch with the changes made from the current solution.
Deploy a full copy of the new solution with the changes using the upgrade option.
Deploy a full copy of the current solution with the changes using the upgrade option.

Deployment option for automation enhancements

Deploy the new solution and then deploy a full copy of the original solution. Use the upgrade option for both deployments.
Deploy a full copy of the original solution and then deploy the new solution. Use the upgrade option for both deployments.
Deploy a full copy of the original solution using the upgrade option. Then, deploy the new solution by using the update option.

Answer 04 - 12

Correct Answer:

Deployment option for changes to an unrelated table

Deploy a patch with the changes made from the current solution.
Deploy a full copy of the new solution with the changes using the upgrade option.
Deploy a full copy of the current solution with the changes using the upgrade option.

Deployment option for automation enhancements

Deploy the new solution and then deploy a full copy of the original solution. Use the upgrade option for both deployments.
Deploy a full copy of the original solution and then deploy the new solution. Use the upgrade option for both deployments.
Deploy a full copy of the original solution using the upgrade option. Then, deploy the new solution by using the update option.

Explanation

The key clue is:

"The Onsite Visit managed solution has a table that is not in the Verification Process Automation managed solution. This table must be upgraded prior to the go-live date without the other shared components."

This means a **patch** should be used for a small change affecting an unrelated table, while automation enhancements that affect shared components should be deployed as a full solution upgrade.

Why?

- **Patch** = small, targeted updates to existing managed solutions without affecting unrelated components.
- **Upgrade** = used when introducing enhancements and changes to solution components while ensuring proper removal of obsolete components and maintaining managed solution integrity.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/83463-exam-pl-200-topic-13-question-2-discussion/>

CASE 5: ALPINE SKI HOUSE

Background -

Alpine SKi House is a boutique mountain resort that offers year-round spa and outdoor activities such as snow sports, hiking, mountain biking, and more. The resort has been family owned and operated for more than 50 years. The company has been able to remain profitable while not needing to adopt new technologies.

Current environment. General -

Booking at the resort have decreased. The company has decided to focus on creating a tailored, first- class experience for guest. The company also plans to target corporate meetings and events.

The company recently purchased a chatbot named FAQbot from AppSoure. The chatbot uses the resort's existing FAQs

Current environment. Communication -

- Communication between staff members is primarily conducted through email and SMS text messages.
- Conversations between staff members and guest often lost.
- Conference calls are used for all group meeting

Current environment. Event Registration -

- Corporate customers can reserve a meeting room at the resort to host meetings. The meetings will include lunch and choice of either an inside-spa experience or a seasonally appropriate outdoor activity.
- Event registration is conducted three weeks prior to start of the event. It is assumed that all event attendees will attend the meeting.

Current environment. Check-in process -

- Guests wait in lines to check in and obtain name badges. At this time, guests can specify any dietary restrictions and select their activity preference. This can result in long wait times and crowding at the front desk.
- For health and compliance reasons, guests must answer a series of questions with a yes or no answer during check-in. The front desk will ask and record these answers for the resort's records.

Current environment. Marketing –

At the check-in counter, the guests can drop their business cards into a bowl for a chance to win an all-inclusive weekend stay at the resort. The resort uses the business card information to send announcements about promotions and upcoming events.

Current environment. Resort policies and event inquiries –

- A guest can call or send an email to the event coordinator at the resort to get information about hotel policies, snow conditions, or to pre-select their after-meeting event;
- Guests can also go to the website to view the extensive list of frequently asked questions (FAQ) compiled over the years. Many of the answers to the FAQs are out of date.

Requirements. General –

Alpine Ski House does not employ technical staff and does not have the budget to hire an external firm to develop solutions. There are two team members who are proficient at Microsoft Excel formulas. Any solution created must use the capabilities of current team members.

All solutions must be simple to use, easy to maintain, and represent the brand of the resort.

You must implement the following solutions:

- a centrally managed communication solution
- a customer service solution
- a resort portal
- a chat solution
- a check-in solution

Requirements. Communication -

- Communication between team members must be centrally managed and unified in Microsoft Teams.
- When the company confirms an event, they must provide a list of guest's names and email addresses.
- You must send guests a welcome email that includes a unique registration number for authentication with the resort's portal.
- Guests must receive a separate email to verify proof of ownership for their registration.

Requirements. Event attendance -

- Guests must create an account and sign into resort portal to confirm their attendance to an event and preselect an after-meeting event.
- Prior to the event, guests must be able to identify any personal dietary restrictions.

Requirements. Check-in processes -

- Check-in processes must be self-service. Each screen must ask for specific data from the guest. The check-in solution Will use some data that is stored in Microsoft Excel.

- The check-in solution must continue to function if there are internet issues. If the self-service kiosks are not available, staff must be able to use the check-in solution from within their communication solution.
- The check-in solution must have a screen where the guest Will select either **yes** or **no** to health and wellness questions. Guests must physically interact with each answer before proceeding to the next screen.
- Guests must be able to confirm any dietary restrictions they may have entered from the portal or add new ones at this time.
- Data must be entered in each screen before users move on to the next screen.

Requirements. Marketing -

- To eliminate the handling of business cards, the check-in solution must be able to translate the contents of the business cards into Alpine Ski House's marketing system.
- The solution must not require any effort or manual entry from the guest to prevent any mistyped information and to make it more appealing to the guest to participate.

Requirements. Hotel policies and event inquiries -

The portal must allow the guest to ask questions about hotel policies, event information, weather reports, and current weather condition at the resort.

Requirements. Chat solution -

The chat solution must specifically address the following key words. NO additional key words Will be added until a later implementation phase:

- Snow reports
- Weather conditions
- Start time
- End time
- Event date
- Outdoor activities
- Indoor activities
- Most popular

The chat solution must be available always and not require staff to answer all of the questions. If a question does require a staff member's attention, the solution must determine which staff member is best to assist the customer with the question.

The information in the FAQ on the legacy website must be used in the chat solution but retyping all the data from the website should not be required. If quests ask about topics that are not listed in the FAQ the chat solution must identify the issue and escalate to a staff member.

Team members must be able to ask their own questions through a centrally managed communication solution instead of using the guest portal. Team members must be able to access the same FAQ across multiple solutions.

Issue:

Guest1 inquires about snow conditions several times each day of their stay.

Question 05 - 01

You need to embed the check-in solution into the communication solution. To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

What must you use to embed the check-in solution?

	▼
Visual Studio	
Power Apps Web Studio	
AI Builder	
Common Data Service	

Where must the check-in solution be available within the communication solution?

	▼
chat section of the solution	
Microsoft 365 Apps selection grid	
in an embedded webpage	
in a tab	

Answer 05 - 01

Correct Answer:

Answer Area

What must you use to embed the check-in solution?

	▼
Visual Studio	
Power Apps Web Studio	
AI Builder	
Common Data Service	

Where must the check-in solution be available within the communication solution?

	▼
chat section of the solution	
Microsoft 365 Apps selection grid	
in an embedded webpage	
in a tab	

Explanation:

The communication solution is **Microsoft Teams**. The requirement states:

"If the self-service kiosks are not available, staff must be able to use the check-in solution from within their communication solution."

The recommended approach is to embed the Power Apps check-in application in **Microsoft Teams as a tab**.

- **Power Apps Web Studio** is used to configure and publish the app for Teams integration.
- A **Teams tab** provides direct access to the app within the centrally managed communication solution.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/65986-exam-pl-200-topic-8-question-1-discussion/>

Question 05 - 01

You need to add controls to the check-in solution for the health and wellness questions.
Which form control should you use?

- A. Drop down
- B. Check box
- C. Text input

Answer 05 - 02

Correct Answer: B

Explanation:

The case states:

*"The check-in solution must have a screen where the guest will select either **yes or no** to health and wellness questions."*

"Guests must physically interact with each answer before proceeding to the next screen."

A **Check box** is the most appropriate control for capturing Yes/No responses and requiring user interaction before continuing.

Why not the others?

- **A. Drop down**
 - Requires opening a list and selecting a value.
 - Not ideal for quick health-screening questions.
- **C. Text input**
 - Allows free-form text and does not enforce a Yes/No response.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/62057-exam-pl-200-topic-8-question-2-discussion/>

Question 05 - 03

You need to design the resort portal to meet the business requirements.
Which data source should you use?

- A. Microsoft Dataverse
- B. Microsoft Excel
- C. Azure SQL Database
- D. SQL Server

Answer 05 - 03

Correct Answer: A

Explanation:

The resort portal is a **Power Pages** solution where guests must:

- Create accounts and authenticate.
- Confirm event attendance.
- Select activities.
- Maintain dietary restrictions.
- Interact with the chatbot and portal data.

Microsoft Dataverse is the native and recommended data source for Power Pages because it provides:

- Built-in security and authentication
- Integration with Power Pages
- Support for contacts, registrations, and portal users
- Low-code administration suitable for a company without developers
- Easy integration with Power Apps, Power Automate, and Power Virtual Agents

Why not the others?

- **B. Microsoft Excel**
 - Appropriate for some check-in data, but not as the primary data source for a secure customer portal
- **C. Azure SQL Database**
 - Requires more technical expertise and maintenance than Dataverse.
- **D. SQL Server**
 - Not the recommended backend for a Power Pages portal and would increase complexity.

Discussion: <https://www.examtactics.com/discussions/microsoft/view/81451-exam-pl-200-topic-8-question-3-discussion/>

Question 05 - 04

You need to design the resort portal's email registration process.

Which solutions should you use? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Requirement	Solution
Implement the invitation code redemption process.	Auto-populate the invitation code field on the sign-in screen from the email link. Embed the invitation code in the email link URL. Send the customer their username and temporary password in the email link.
Validate the user's email.	Two-factor authentication Azure Active Directory authentication Social provider sign-in Invitation code sign-up

Answer 05 - 04

Correct Answer:

Answer Area

Requirement	Solution
Implement the invitation code redemption process.	Auto-populate the invitation code field on the sign-in screen from the email link. Embed the invitation code in the email link URL. Send the customer their username and temporary password in the email link.
Validate the user's email.	Two-factor authentication Azure Active Directory authentication Social provider sign-in Invitation code sign-up

Explanation:

Implement the invitation code redemption process → Embed the invitation code in the email link URL

- Allows the invited user to redeem the invitation automatically when following the registration link.

Validate the user's email → Invitation code sign-up

- The **Invitation code sign-up** mechanism validates that the user owns the invitation associated with the email address and allows secure registration.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/60816-exam-pl-200-topic-8-question-4-discussion/>

Question 05 - 05

You need to design the resort portal's email registration process.
Which solution should you use?

- A. Default the invitation code from the email upon logging into the portal
- B. Auto-populate the invitation code field on the sign in screen from the email link
- C. Embed the invitation code in the email link URL
- D. Send the customer their username and temporary password in the email link

Answer 05 - 05

Correct Answer: C

Explanation:

In Power Pages/Power Apps Portals, the standard invitation redemption process includes sending the user a link that contains the invitation code. When the user clicks the link, the portal can automatically process the invitation and validate the registration flow.

- **Therefore: C. Embed the invitation code in the email link URL**
 - This is the standard invitation redemption mechanism.

Why the other options are incorrect:

- **A. Default the invitation code from the email upon logging into the portal**
 - Invitation codes are not typically defaulted after login.
- **B. Auto-populate the invitation code field on the sign-in screen from the email link**
 - The invitation code can be auto-populated, but the recommended design is to **embed the code in the URL** itself.
- **D. Send the customer their username and temporary password in the email link**
 - Sending usernames and temporary passwords in the URL is insecure and not a portal invitation feature.

Discussion: <https://www.examtips.com/discussions/microsoft/view/87333-exam-pl-200-topic-8-question-5-discussion/>

Question 05 - 06

You need to be able to move a Power Automate desktop flow used in the verification process to the testing environment.
What should you do?

- A. Share a copy of the desktop flow with a member of internal IT.
- B. Use the Export option in the flow to get the flow identifier and provide it to internal IT.
- C. Send a copy of the desktop flow to a member of internal IT.

D. Create the desktop flow in a solution and provide it to internal IT.

Answer 05 - 06

Correct Answer: D

Explanation:

For ALM (Application Lifecycle Management), **Power Automate desktop flows must be added to a solution** to be moved between environments (Development → Test → Production). The solution can then be exported and imported into the target environment.

Therefore D: placing the desktop flow in a **solution** enables transport to the testing environment.

- **A** Sharing does not move the flow between environments.
- **B** Exporting only a flow identifier is not a deployment method.
- **C** Sending a copy is not the recommended ALM approach and does not support environment deployment.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/83461-exam-pl-200-topic-9-question-1-discussion/>

Question 05 - 07

You need to design the FAQ solution to handle unknown responses.

Which component should you use? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Requirement	Component
Handle an unknown question from a guest in a conversation.	Escalate Fallback topic Failure path
Redirect a guest with an unknown question to a live staff member.	Power Apps Power Virtual Agents web application Microsoft Teams Omnichannel for Dynamics 365 Customer Service

Answer 05 - 07

Correct Answer:

Answer Area

Requirement	Component
Handle an unknown question from a guest in a conversation.	Escalate Fallback topic Failure path
Redirect a guest with an unknown question to a live staff member.	Power Apps Power Virtual Agents web application Microsoft Teams Omnichannel for Dynamics 365 Customer Service

Explanation:

- **Fallback topic** is triggered when the bot cannot match the user's question to an existing topic (such as snow reports, weather conditions, event dates, etc.). It handles unknown or unrecognized utterances.
- **Omnichannel for Dynamics 365 Customer Service** enables escalation from the chatbot to a live agent/staff member and can route the conversation to the most appropriate staff member.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/62640-exam-pl-200-topic-10-question-1-discussion/>

Question 05 - 08

You need to embed the FAQbot into the communication solution.

Which actions should you perform? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Requirement	Action
Add the new FAQ solution to the communication solution for the first time.	Import an existing app. Create a new app. Import a new page. Import bot.
Configure the FAQ solution in Microsoft Teams.	Configure the FAQbot. Import a chatbot. Create a new chatbot.

Answer 05 - 08

Correct Answer:

Answer Area

Requirement	Action
Add the new FAQ solution to the communication solution for the first time.	Import an existing app. Create a new app. Import a new page. Import bot.
Configure the FAQ solution in Microsoft Teams.	Configure the FAQbot. Import a chatbot. Create a new chatbot.

Explanation:

- Since **FAQbot already exists**, you do **not** create a new app or new chatbot.
- To add an existing Power Virtual Agents/Copilot Studio solution into Teams, you **import the existing app**.

- Then you **import the chatbot** into Microsoft Teams so users can interact with it from the centralized communication solution.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/64137-exam-pl-200-topic-10-question-2-discussion/>

Question 05 - 09

Exam PL-200 topic 10 question 3 discussion

Actual exam question from Microsoft's [PL-200](#)

Question #: 3

Topic #: 10

HOTSPOT -

A guest asks about the start time of a specific scheduled event and wants to know what the snow conditions will be like during their stay.

You need to determine how to design the chat solution to answer those questions.

What should you do? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Scenario	Action
Identify and reference the company event a guest mentions.	▼ Load the response into a variable Use smart matching to load an entity into a topic Load the extracted topic into a variable
Identify attributes for snow conditions.	▼ Create a custom entity Create a new topic Create a new variable Create an escalation

Answer 05 - 09

Correct Answer:

Answer Area

Scenario	Action
Identify and reference the company event a guest mentions.	▼ Load the response into a variable Use smart matching to load an entity into a topic Load the extracted topic into a variable
Identify attributes for snow conditions.	▼ Create a custom entity Create a new topic Create a new variable Create an escalation

Explanation:

- To identify a specific event mentioned by the guest (for example, a corporate event name), use an **entity** and enable **smart matching** so the bot can recognize variations of the event name and pass the value into the topic.
- Snow conditions involve specific values or attributes (powder, icy, groomed, fresh snow, depth, etc.). These are best modeled as a **custom entity** that the chatbot can recognize and use in conversation.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/62202-exam-pl-200-topic-10-question-3-discussion/>

Question 05 - 10

You need to design the chat solution to answer the inquiry from Guest1.

Which three components can you use? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. Variables
- B. Escalations
- C. Smart match
- D. Synonyms
- E. Topics

Answer 05 - 10

Correct Answer: C,D,E

Explanation:

The inquiry is about **snow conditions**, which is one of the predefined keywords for the chatbot. To answer such questions effectively in Power Virtual Agents/Copilot Studio, you need:

- A **Topic** to handle the snow conditions conversation.
- **Synonyms** so different phrases such as "snow report", "snow conditions", "ski conditions", etc. trigger the same topic.

- **Smart match** to recognize variations in how guests ask the question.

You do **not** need:

- **Variables** (not required just to identify and answer the inquiry).
- **Escalations** (used when the bot cannot answer or needs a human agent).

Discussion: <https://www.examttopics.com/discussions/microsoft/view/62448-exam-pl-200-topic-10-question-4-discussion/>

Question 05 - 11

Guest1 inquires about snow conditions several times during each day of their stay.

You need to create the FAQ solution content.

What should you do first?

- A. AI Builder
- B. Automate
- C. Suggest topics
- D. Trigger phrases

Answer 05 - 11

Correct Answer: C

Explanation:

The inquiry is about **snow conditions**, which is one of the predefined keywords for the chatbot. To answer such questions effectively in Power Virtual Agents/Copilot Studio, you need:

- A **Topic** to handle the snow conditions conversation.
- **Synonyms** so different phrases such as "snow report", "snow conditions", "ski conditions", etc. trigger the same topic.
- **Smart match** to recognize variations in how guests ask the question.

You do **not** need:

- **Variables** (not required just to identify and answer the inquiry).
- **Escalations** (used when the bot cannot answer or needs a human agent).

Discussion: <https://www.examttopics.com/discussions/microsoft/view/64138-exam-pl-200-topic-10-question-5-discussion/>

Question 05 - 12

Guest1 inquires about snow conditions several times during each day of their stay.

You need to design and create the solution for gathering contact information from guests for marketing purposes.

What should you use? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Action	Solution
Extract business card data.	AI Builder Common Data Service Power Virtual Agents Power Automate
Implement the contact gathering solution.	Create a new entity extraction component. Integrate the solution with Azure Cognitive Services. Use a prebuilt AI model.

Answer 05 - 12

Correct Answer:

Answer Area

Action	Solution
Extract business card data.	AI Builder Common Data Service Power Virtual Agents Power Automate
Implement the contact gathering solution.	Create a new entity extraction component. Integrate the solution with Azure Cognitive Services. Use a prebuilt AI model.

Explanation:

For this requirement:

- The resort wants to capture information from business cards automatically.
- Guests should not manually enter data.
- Alpine Ski House has limited technical skills and requires a low-code solution.

Why?

- **AI Builder** includes a **Business Card Reader** prebuilt model that extracts contact details such as name, company, phone number, email address, and job title from a photo of a business card.
- Using a **prebuilt AI model** satisfies the low-code/no-code requirement and avoids the need to build custom AI models or integrate external services.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/66708-exam-pl-200-topic-12-question-1-discussion/>

Question 05 - 13

You need to embed the business card solution in the check-in app.
What should you use?

- A. Input control
- B. Custom component
- C. Button control
- D. AI Builder component

Answer 05 - 12

Correct Answer: D

Explanation:

The requirement is to **embed the business card reader functionality directly into the check-in app**.

Power Apps provides an **AI Builder Business Card Reader component** that can be added to a canvas app. This component allows users to scan a business card and automatically extract contact information (name, email, phone number, company, etc.) without manual entry.

- **A. Input control** (Incorrect) – Used for manual data entry.
- **B. Custom component** (Incorrect) – Unnecessary because a built-in AI Builder component already exists.
- **C. Button control** (Incorrect) – Can trigger actions but does not provide business card recognition.
- **D. AI Builder component** (Correct) – Specifically designed for business card scanning and data extraction.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/65376-exam-pl-200-topic-12-question-2-discussion/>

Question 05 - 13

Exam PL-200 topic 12 question 3 discussion

Actual exam question from Microsoft's [PL-200](#)

Question #: 3

Topic #: 12

HOTSPOT -

You need to design the guest check-in solution.

Which technologies should you use? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Requirement	Technology
Develop the base check-in solution.	Xamarin app Power Apps portal Model-driven app Canvas app
Access the check-in solution on the check-in devices.	Traditional desktop application Web browser Power Apps mobile app Dynamics 365 for phones and tablets

Answer 05 - 13

Correct Answer:

Answer Area

Requirement	Technology
Develop the base check-in solution.	▼ Xamarin app Power Apps portal Model-driven app Canvas app
Access the check-in solution on the check-in devices.	▼ Traditional desktop application Web browser Power Apps mobile app Dynamics 365 for phones and tablets

Explanation:

For the guest check-in solution:

Requirement 1: Develop the base check-in solution → Canvas app

Why?

- The check-in process requires multiple custom screens.
- Users must enter data on each screen before proceeding.
- The solution must work on kiosks and be easy to customize.
- Canvas apps support offline capabilities and AI Builder components.

Requirement 2: Access the check-in solution on the check-in devices → Power Apps mobile app

Why?

- The requirement states the solution must continue to function during internet issues.
- Canvas apps can be run through the **Power Apps mobile app**, which supports offline scenarios.
- This is the standard approach for kiosk/tablet-based Power Apps solutions.

Discussion: <https://www.examttopics.com/discussions/microsoft/view/61518-exam-pl-200-topic-12-question-3-discussion/>
